In addition to independent research done by the Branch staff, considerable co-operative work is undertaken with staff of agricultural faculties and provincial governments. Furthermore, through operating and extramural grants, support is given to research workers at the universities. Close liaison is maintained with these agencies to avoid unnecessary duplication of program and special attention is given to maintaining contact with provincial extension officers. Branch establishments across the country are represented on provincial committees concerned with making recommendations on crop varieties, fertilizers, cultural practices, pest control, animal management, and other problems. Such collaboration ensures that research results of immediate practical value are made available to extension officers and to producers as quickly as possible.

Grain Research Laboratory.—This Research Laboratory provides scientific services required in the administration of the Canada Grain Act. It carries out annual studies of the quality of the new crop cereals, maintains a continuous check of the quality of cereal grains as they move forward from the farm to marketing positions and plays a major role

in testing (prior to licensing) the quality of plant breeders' varieties of various cereals. A comprehensive program of basic and applied research relating to the quality of Canadian cereal grains is an important task of the Laboratory.

Health of Animals Branch.—This Branch administers the Animal Contagious Diseases Act, the Meat Inspection Act and the Humane Slaughter of Food Animals Act, and operates laboratories for the study of animal diseases. Contagious diseases of animals are controlled through preventive measures of inspection and quarantine of imported livestock and restricted commodities such as meat, farm products and other possible

The technique of using aerial photography for the detection and measurement of disease in agricultural areas is under development by federal scientists of the Canada Department of Agriculture, as part of a nationwide program to estimate disease losses.

A pilot and cameraman prepare to patrol, by light aircraft, an area suspected of being diseased. Photographs taken at daily intervals indicate the spread of disease and its general movement.

Diseased areas of a potato leaf being estimated by computer scanner in the laboratories of the Ottawa Research Station.

sources of infection; through conducting disease eradication programs, notably of bovine tuberculosis, brucellosis and Johne's disease; through the control and eradication of serious animal diseases when outbreaks occur; and through inspection and certification as to health of livestock for export.

The Animal Pathology Division consists of the Animal Diseases Research Institute at Hull, Que., the Animal Diseases Research Institute (Western) at Lethbridge, Alta., and seven other laboratories; these establishments conduct research and investigations on diseases of animals and produce the biological products required in the control programs of the Branch. The Division also provides diagnostic services for diseases of domestic and wild animals; provides a consultation service regarding veterinary biologics and other agents used in the control of animal diseases; and assists in training departmental officers and technicians as well as veterinarians from other lands. The Meat Inspection Division conducts ante-mortem examinations; ensures the application of strict humane slaughter regulations for all food animals; conducts continuous post-mortem examinations of animals slaughtered at packing plants in which they operate; and ensures maintenance of sanitary standards during processing of the products, accurate labelling, and the proper kind and use of ingredients and preservatives—all in an effort to guarantee the marketing of wholesome unadulterated meats and meat food products.

Economics Branch.—The Economics Branch advises the Minister and the Department of Agriculture on the economic implications of proposed and existing policies and programs; and conducts research on the economics of production, processing, marketing and resource use of agriculture, as a basis for policy advice and establishment of guidelines for development and adjustment within agriculture. It develops and interprets market outlook information on short-term, intermediate and long-term supply and demand trends, prospects and composition; and evaluates these prospects internationally, nationally and regionally to assist Canadian agriculture in adjusting to change and meeting market requirements. The Branch is divided into three Divisions—Research, Farm Management, and Marketing and Trade—and includes an economic planning secretariat. Regional offices are located in the Maritimes, the Prairie Provinces and British Columbia.

Production and Marketing Branch.—The Production and Marketing Branch conducts many of the promotional and regulatory functions of the Department. Six specialized divisions administer legislation and policies in the production and marketing of livestock, poultry, fruits and vegetables, dairy products and plant products, and policies in connection with the control of disease in plants.

The *Livestock Division* administers legislation dealing with the grading of meat, wool and fur, with the registration of livestock pedigrees, with performance testing of cattle and hogs and with the supervision of racetrack betting. Other activities include the promotion of livestock improvement and the compilation of market statistics. The *Poultry Division* carries out the policies of the national poultry breeding program, including Record of Performance for poultry and hatchery inspection, and administers the regulations for the grading of poultry products. The *Fruit and Vegetable Division* administers legislation having to do with the grading of fruits and vegetables in both fresh and processed form, maple products and honey. The Division is responsible for the licensing of inter-provincial and international dealers and brokers who deal in fresh fruits and vegetables. The *Dairy Division* administers legislation covering grades and standards for dairy products, including butter, cheese, concentrated milk products and ice cream. The *Plant Products Division* administers Acts and regulations respecting seeds, feeds, fertilizers and pest-control products, conducts field inspections and maintains regional testing laboratories. The *Plant Protection Division* is responsible, under the Destructive Insect and Pest Act, for safeguarding against the introduction of serious plant insects or diseases into Canada or their spread in Canada, for certifying freedom from disease and pests in plant exports, and for seed potato certification.

Administration and Information.—The Financial and Administration Branch provides central advisory and specialized staff services for the financial and business management of the Department and advises the Senior Executive in developing financial and administrative policies and programs. Personnel policies and programs for approximately 10,000 employees of the Department, including scientific and professional groups, technical, administrative and other support staff at various locations across Canada, are conducted by the Personnel Administration Branch.

The Information Division gathers and disseminates information on the research, development and regulatory work of the Department, giving service to the news media, to agricultural extension workers and directly to the public through publications, press and radio releases, television material, motion pictures and exhibits.

Subsection 2.—Farm Assistance Programs

Basic to the concept of Canada's national agricultural policy is the premise that a stable agriculture is in the interests of the national economy and that farmers as a group are entitled to a fair share of the national income. In pursuit of these objectives, the Department of Agriculture has carried on, over a long period, programs designed to aid agriculture through the application of scientific research and the encouragement of improved methods of production and marketing. Over the years, as conditions have warranted, programs have been initiated to deal with special situations such as the Prairie Farm Assistance Act (p. 562) to mitigate the effects of crop failure, Feed Grain Assistance Regulations (p. 563) to assist in the movement of western feed grains to Eastern Canada and British Columbia, and other programs recently transferred to the new Department of Regional Economic Expansion—the Maritime Marshland Rehabilitation Act to save valuable soil in the Maritime Provinces, and the Prairie Farm Rehabilitation Act (p. 543), primarily concerned with combating drought in the agricultural areas of the Prairie Provinces.

Although much has been accomplished and is still being accomplished by these measures, changes in the past two decades have dictated the need for a different approach to some problems. Large-scale mechanization and, in some segments of the industry, automation reduced manpower requirements very significantly; the number of farms declined but the size of farms increased; marketing and income problems took different forms; and a decline in some rural communities occurred together with problems of increasing regional disparity. Legislation enacted to meet these situations includes price support (Agricultural Stabilization Act), dairy market and producer income stabilization (Canadian Dairy Commission), crop insurance (Crop Insurance Act), Agricultural and Rural Development Act (ARDA) and Fund for Rural Economic Development (FRED), feed grain assistance (Livestock Feed Assistance Act) and credit facilities (Farm Improvement Loans Act, Farm Credit Act and Farm Syndicates Credit Act). These measures, with the exception of the ARDA and FRED programs (see Chap. XXIV, Sect. 6, Subsect. 2) are administered by the Department of Agriculture.

Agricultural Stabilization Act.—The Agricultural Stabilization Act (SC 1958, c. 22, proclaimed Mar. 3, 1958) established the Agricultural Stabilization Board and repealed the Agricultural Prices Support Act, 1944. The Board is empowered to stabilize the prices of agricultural products in order to assist the agricultural industry in realizing fair returns for labour and investment, and to maintain a fair relationship between prices received by farmers and the costs of goods and services that they buy.

The Act provides that, for each production year, the Board must support, at not less than 80 p.c. of the previous 10-year average market or base price, the prices of nine commodities (cattle, hogs and sheep; butter, cheese and eggs; and wheat, oats and barley produced outside the prairie areas as defined in the Canadian Wheat Board Act). Other commodities may be supported at such percentage of the base price as may be approved by

the Governor in Council. Since the Act came into force, the following farm products, other than the nine named commodities, have been supported at one time or another: honey, potatoes, soybeans, sunflower seeds, sugar beets, tobacco, turkeys, apples, peaches, sour cherries, apricots, raspberries, asparagus, tomatoes, milk for manufacturing and skim milk powder. The Board may stabilize the price of any product by an offer-to-purchase, by a deficiency payment, or by making such payment for the benefit of producers as may be authorized.

In stabilizing prices of certain commodities by means of deficiency payments, the price stabilization program has been assisting the agricultural industry to make production adjustments from a position of excessive supply to one of more normal relationship between supply and demand. The institution of limited deficiency payments by the Board assists in the adjustment of production in a relatively short time. During the period of adjustment, the Board guarantees a minimum average return to producers for a limited quantity of product.

The cost of stabilization programs under the Act has averaged approximately \$74,000,000 a year. The Board has available a revolving fund of \$250,000,000, according to the Act. Losses incurred are made up by Parliamentary appropriations and any surplus is paid back to the Consolidated Revenue Fund. An Advisory Committee named by the Minister of Agriculture and composed of farmers or representatives of farm organizations assists the Board in its operations.

Canadian Dairy Commission Act.—The Canadian Dairy Commission was established by the Canadian Dairy Commission Act, 1966, and became operative on Apr. 1, 1967. The affairs of the Commission are directed by three Commissioners, and its objects are “to provide efficient producers of milk and cream with the opportunity of obtaining a fair return for their labour and investment and to provide consumers of dairy products with a continuous and adequate supply of dairy products of high quality”.

To perform its functions, the Commission is authorized to stabilize prices of major dairy products through offers to purchase at fixed prices, thus establishing stable prices in the interests of both producers and consumers. The Commission may borrow from the Minister of Finance the funds required for such purchases to a maximum of \$100,000,000, which must be repaid.

The Commission administers the payment of funds provided by the Government for subsidies to producers of milk and cream used in the production of dairy products. These payments supplement returns to producers from the market and permit market prices to be kept at reasonable levels. The total quantity of milk and cream on which subsidy is paid is restricted to the volume required to serve the Canadian domestic market. Each producer is given a quota for the amount for which he is eligible for subsidy. The Commission, indirectly, pools returns to producers from products sold on the domestic and export markets through an export equalization fund. Money for this is deducted from the subsidy and payments are made to equalize export prices with domestic prices for any surplus products that must be exported.

The Commission also has authority, under regulation by the Governor in Council, to exercise control of the interprovincial and export movement of dairy products, and to perform other functions related to its responsibilities.

Crop Insurance Act.—To assist in making the benefits of insurance protection on crops available in all provinces, the Crop Insurance Act was passed in 1959. This Act does not set up any specific insurance scheme but rather permits the Federal Government to assist the provinces to do so by making direct contributions toward the cost of providing crop insurance. The initiative for establishing schemes to meet their own regional requirements rests with the provinces. Schemes may be organized on the basis of specific crops or areas within the provinces and agreements between the provinces and the Federal Government set out the terms of insurance coverage.

Under the Act and amendments of 1964 and 1966, the Federal Government will pay 50 p.c. of the administrative costs incurred by a province and 25 p.c. of the amount of premiums required to make the scheme actuarially sound. In addition, the Federal Government may make loans to any province equal to 75 p.c. of the amount by which indemnities required to be paid under policies of insurance exceed the aggregate of the premium receipts for that year, the reserve for the payment of indemnities, and \$200,000. As an alternative to such loans, the Federal Government may re-insure a major portion of the provincial risk in a program operated under the Crop Insurance Act. Farmers insured under the Act are not eligible for payments under the Prairie Farm Assistance Act, nor are they required to pay the 1-p.c. levy on grain sales as provided for under that Act.

In the year ended Mar. 31, 1969, 62,359 farmers purchased \$162,936,000 worth of insurance coverage for their crops under 68 different crop insurance plans. Premiums charged totalled \$11,903,000 (including the federal share) and indemnities paid out approached \$18,200,000 as compared with \$13,100,000 in 1968. The relatively high indemnities paid to farmers were due to high losses in certain areas and localities rather than a general crop loss situation. In the Fraser and Okanagan Valleys of British Columbia, cold weather in December 1968 and January 1969 caused considerable damage to strawberry plants, fruit trees, and the potential fruit crop. Excessive wet weather during the fall season in central and northern Alberta resulted in most of the cereal crops being left unharvested before snowfall. Some of these crops were a complete loss and others harvested in the spring of 1970 were low in grade and yield. Excessive moisture in the spring and summer months caused crop losses in southeastern Manitoba and southwestern Ontario and made harvesting of forage crops difficult in Quebec. Although these adverse conditions caused most of the losses, many farmers also experienced lost production from drought, fall frost, spring frost, virus disease and wind damage.

Farm Improvement Loans Act.—The Farm Improvement Loans Act (RSC 1952, c. 110), administered by the Department of Finance, is designed to facilitate the availability of credit by way of loans made by the chartered banks to assist in almost every conceivable purchase or project for the improvement or development of a farm and includes the purchase of agricultural implements, the purchase of livestock, the purchase and installation of agricultural equipment or a farm electrical system, the erection or construction of fencing or works for drainage on a farm, and the construction, repair or alteration of farm buildings including the family dwelling, and the purchase of additional land for the purpose of farming. Credit is provided on security related to the purchase or project and on terms suited to the individual borrower.

The legislation, originally operative for three years (1945-48), has been continuous by way of extensions, usually for three-year periods. The latest extension was for the period July 1, 1968 to June 30, 1971. The maximum repayment period for land purchase is 15 years and for all other purposes 10 years. The interest rate is prescribed in the regulations and is adjustable semi-annually on Apr. 1 and Oct. 1 of each year to reflect changes in the levels of interest rates generally. The borrower is required to provide from 10 p.c. to 33½ p.c. of the cost of his purchase or project, depending on the loan category to which it belongs. The Federal Government guarantees each bank against loss sustained by it up to an amount equal to 10 p.c. of loans granted by it in a lending period. This guarantee does not apply to any loan made after the aggregate of all loans made by all banks in a given period reaches an amount fixed by statute. The current maximum stands at \$900,000,000 which may be lent by the chartered banks and a limit of \$300,000,000 which may be lent by other designated lenders. By Dec. 31, 1969, 3,886 claims amounting to \$3,267,382 had been paid under the guarantee since the inception of the Act, representing a net loss ratio of less than one tenth of 1 p.c. after recoveries have been taken into account. The maximum loan or amount that may be outstanding to a borrower at any one time stands at \$25,000.

Prairie Grain Advance Payments Act.—This Act, which came into force on Nov. 25, 1957, and was subsequently amended in August 1958 and November 1968, provides for interest-free advance payments to producers in Western Canada for farm-stored threshed grain (wheat, oats and barley). Advance payments of \$1 per bushel of wheat, 40 cents

per bushel of oats and 70 cents per bushel of barley are made subject to certain restrictions as to quota and acreage. The total of advances obtained in any crop year may not exceed \$6,000. Repayment is effected by deducting 50 p.c. of the initial payment for wheat, oats and barley delivered subsequent to the loan until the producer has discharged his advance.

Farm Credit Act.—The Farm Credit Act (SC 1959, c. 43, proclaimed on Oct. 5, 1959) established the Farm Credit Corporation as successor to the Canadian Farm Loan Board established in 1929. The Corporation, which is a Crown agency, reports to Parliament through the Minister of Agriculture.

The Act provides two types of long-term mortgage loans for farmers. Under Part II the Corporation may lend up to 75 p.c. of the appraised value of the farm land and buildings taken as security, not exceeding \$40,000 for one, \$80,000 for two or \$100,000 for three or more owner-operators principally occupied in a single farming business. Under Part III loans may be made up to 75 p.c. of the appraised value of the land and chattels, not exceeding \$55,000 for one or \$100,000 for two or more qualified owner-operators in a single farm business. Special provision is made under this Part for loans up to 90 p.c. of farm assets where the owner-operator is under age 35 and the management of the farm is considerably above average. Part III loans are further secured by insurance on the life of the borrower, and his farming operations are subject to supervision by the Corporation. Similar life insurance and supervision are available to Part II borrowers on an optional basis.

Under both Parts, applicants must be at least 21 years of age and principally occupied in farming. Individual borrowers under Part III must be between 21 and 45. To qualify for more than \$55,000 under Part III, there must be at least two owner-operators under 45, or one under 35. All loans are repayable on an amortized basis within a period not exceeding 30 years. The interest rate is set by Order in Council and varies with the cost of money to the Corporation.

The Corporation has 122 field offices administered by 253 credit advisers who are responsible for informing local farmers about the services available, for pre-loan counselling on credit use, farm planning and farm management, for accepting applications and for making farm appraisals.

In addition to the amounts repaid by borrowers, funds for lending to farmers may be borrowed by the Corporation from the Minister of Finance. The aggregate amount of such borrowings outstanding at any time may not exceed 25 times the capital of the Corporation. This capital was raised by amendment to the Act in 1968 from \$40,000,000 to \$56,000,000. There were 68,496 loans to the amount of \$1,111,520,366 outstanding as of Mar. 31, 1970.

Farm Syndicates Credit Act.—The Farm Syndicates Credit Act (SC 1964, c. 29, as amended by SC 1968-69, c. 32) authorizes the Farm Credit Corporation to lend to qualified groups of farmers (referred to as syndicates). A syndicate is a group of three or more farmers, the majority of whom have farming as their principal occupation, who have signed an agreement acceptable to the Corporation with respect to the joint purchase and use of machinery, equipment or buildings which can be used profitably by them in their farming operations. Co-operative farm associations and certain farming corporations may qualify as syndicates for loans without the members entering into a formal agreement.

A syndicate may borrow up to 80 p.c. of the cost of machinery, buildings (including site and other improvements) and installed equipment suitable for joint use, to a maximum of \$15,000 per member or \$100,000, whichever is the lesser. Loans are repayable over a period not exceeding 15 years for buildings and installed equipment, and seven years for mobile machinery. The interest rate is based on the cost of funds to the Corporation, advanced by the Minister of Finance, and its expenses in servicing loans. There is an initial charge of 1 p.c. on the amount of each loan. Security is provided by a promissory note signed by each syndicate member, and such other security as may be required. Up to Mar. 31, 1970, the Corporation had approved loans for 582 syndicates totalling \$7,500,000.

Prairie Farm Assistance Act.—The Prairie Farm Assistance Act, passed in 1939, provides for direct money payments by the Federal Government on an acreage-and-yield basis to farmers in areas of low crop yield in the Prairie Provinces and in the Peace River area of British Columbia. Its purpose is to assist in dealing with a relief problem which the provinces and municipalities cannot do alone and to enable the farmers to put in a crop the following year. Payments for the 1969-70 crop year, as at July 31, 1970, totalled \$5,230,281; payments made under the Act since 1939 amounted to \$383,516,518.

Payments are made from the Prairie Farm Emergency Fund to which farmers contribute 1 p.c. of the value of all sales of wheat, oats, barley, rye, flaxseed and rapeseed. The

additional funds required are provided from the federal treasury. The total collected through the 1-p.c. levy in the 1969-70 crop year, as at July 31, 1970, was \$5,451,832; the amount collected since 1939 was \$207,378,387.

Farmers operating land in the spring wheat area, and not covered by a federal-provincial crop insurance scheme, are eligible for awards. Crop failure and natural causes preventing seeding and summerfallowing are taken into account in making awards. These may not exceed \$800 in respect of any one farmer's total cultivated acreage.

The PFAA administered the Operation LIFT program in 1970. This program offered acreage payments to farmers who reduced wheat and increased summerfallow acreage and was introduced by the Federal Government to alleviate problems arising from the huge wheat surplus. Payments to farmers as of Dec. 17, 1970, amounted to \$47,499,454.

Livestock Feed Assistance Act.—The Livestock Feed Assistance Act (SC 1966, c. 52) established the Canadian Livestock Feed Board, which is a Crown agency reporting to Parliament through the Minister of Agriculture. The Board has four main objects which are to ensure: (1) the availability of feed grain to meet the needs of livestock feeders; (2) the availability of adequate storage space in Eastern Canada for feed grain to meet the needs of livestock feeders; (3) reasonable stability in the price of feed grain in Eastern Canada and in British Columbia; and (4) fair equalization of feed grain prices in Eastern Canada and in British Columbia.

In furtherance of these objectives, the Board may make payments related to the cost of feed grain storage and transportation. Feed grain transportation assistance payments have been made since 1941, and since April 1967 have been made under the authority of the Livestock Feed Assistance Act. Under the Feed Grain Assistance Regulations of the Appropriations Act, the original policy was initiated in October 1941 to provide a market for western feed grains, and to enable livestock feeders in Eastern Canada and British Columbia to obtain supplies of feed grains at a cost that would maintain livestock and poultry production at a high level. This program has been modified over the years to encourage better utilization of both transport and storage facilities.

6.—Freight-Assisted Shipments of Feed Grains, by Province of Destination, Years Ended Mar. 31, 1969 and 1970

Section 3.—Provincial Governments in Relation to Agriculture*

Subsection 1.—Agricultural Services

Newfoundland.—Government agricultural services in Newfoundland are operated by the Agricultural Division of the Department of Mines, Agriculture and Resources. The Division consists of a director and a staff of 64 officers under the administration of the Deputy Minister of Agriculture and Co-operatives. For purposes of administration, the province is divided into nine districts in each of which is located a fieldman with permanent headquarters. Officers in charge of different phases of agricultural development visit each district on assignments from the St. John's office.

Departmental policies in support of the agricultural industry include: a bonus of \$125 an acre on land cleared by privately owned equipment; the distribution of ground limestone at a subsidized rate; the payment of bonuses on purebred sires; and financial assistance to agricultural societies, marketing organizations and exhibition committees. An inspection service is provided for poultry products, vegetables and blueberries, production of the latter being encouraged by the burning of suitable berry areas and the improvement of roads and trails leading to them.

Every encouragement is given to the production of livestock. Favourable marketing conditions and departmental assistance and loans under the Provincial Farm Development Loan Act and the Newfoundland Farm Products Corporation Act have contributed to increased output of poultry products and pork. The Provincial Veterinarian and his staff supervise the health of animals program and the federal-provincial project for the eradication of bovine tuberculosis and brucellosis.

Prince Edward Island.—The Prince Edward Island Department of Agriculture is composed of the following Branches and Divisions. The Extension Services Branch deals with rural extension education generally, through its three Divisions: the Agricultural Economics and Statistics Division; the Agricultural Representative Division which has five district offices, each with an agricultural representative, a home economist and a farm management specialist; and a Women and Youth Division, which includes an Information Section. The Production Sciences Branch supervises the regulatory function of the Department and assists with agricultural extension programs. It has three Divisions: the Soils and Water Division, the Production Science Division and the Veterinary and Dairy Services.

The Department of Agriculture is also responsible for the forestry program in the province, which function comprises a third Branch of the Department; it is described in Chapter XII under "Provincial Forestry Programs".

Nova Scotia.—The Department of Agriculture and Marketing endeavours to "help the people to help themselves" through strengthening member interest in such organizations as the Nova Scotia Federation of Agriculture, the Nova Scotia Fruit Growers' Association, various agricultural co-operative organizations, credit unions and producer and marketing organizations.

New Brunswick.—Provincial government agricultural policy and programs in New Brunswick are administered and directed by the Department of Agriculture and Rural Development. Under the Minister of Agriculture and Rural Development, the Department is administered by a deputy minister, an assistant deputy minister and the directors of Branches concerned with: extension, livestock and dairying, veterinary services, poultry, plant industry, agricultural engineering, home economics, credit unions and co-operatives, agricultural education and rural development. The Department also has a Farm Economics Division and an Information Division, as well as a Farm Adjustment Board and a Dairy Products Commission.

* Prepared by the agricultural officials of the respective provincial governments.

Quebec.—Agricultural policies of the Quebec Government, as applied by the Department of Agriculture and Colonization, are based on one overriding and clearly defined objective—to make agriculture profitable and bring it into line with the social and economic needs of the 1970s.

Its prime target is, therefore, a systematic modernization of farms. Government, in co-operation with agricultural and related associations, is trying to increase and improve production. It is also attempting to guide agriculture along truly professional lines, through conversion of production techniques to meet local needs and skills, through sound land-use development policies, and through adult education and practical management training in agricultural study groups.

To carry out this objective, the Quebec Department of Agriculture is divided into two main Branches—services connected with direct action on the part of the farmer himself, and departmental services directly related thereto, e.g., the regional agricultural offices and laboratories, and personnel and administrative services.

Under the direction of the Minister, Deputy Minister and three Assistant Deputy Ministers, these Branches work in co-operation with the scientific and technical services which function not only as a support group, but also contribute to their general orientation.

The Regional Offices and Laboratories Branch is responsible for counselling as well as for improving and increasing production, along well-considered lines. It is particularly concerned with farm reorganization through regrouping and developing up-to-date and viable units. It exercises a direct influence on farmers through its 12 well-organized regional administrative offices and laboratories.

The Personnel and Administration Branch supplies the manpower, co-ordinating labour relations, staff training and employee services and organizing promotional competitions through the Civil Service system. It also co-ordinates the work of various administrative branches of the Department and, in co-operation with the Accounting Branch, prepares part of the estimates. It also looks after the internal and external needs of the Department as regards supplies and equipment.

Each of these two main Branches operates in a specific field requiring the co-operation of other departmental services such as Legal, Accounting, Grants and Incentives, Agricultural Water Supplies, and Storage and Equipment on the administrative side, and Veterinary Services, Artificial Insemination and Herd Improvement, Farm Organization, Economics, Marketing, Education and Research, and Information services on the regional offices and laboratories side. Each of these Branches therefore plays an important role in the efficient operation of the Department and contributes to its effectiveness in direct action in the field.

The entire departmental structure is rounded out with the Agricultural Marketing Board, Farm Credit Bureau, and Crop Insurance Board, which implement legislation for both the farmer and the consumer. A Crown corporation, the St. Hilaire Sugar Refinery, completes the organization. It promotes the growing of sugar beets in part of the green belt around Montreal.

Ontario.—The Ontario Department of Agriculture and Food conducts a wide variety of programs to develop a sound agricultural industry and to help farmers. Most assistance is through self-help programs which benefit the individual farmer. The Department administers 47 separate legislative Acts, some of which are regulatory on an industry-wide basis.

Through the Agricultural Rehabilitation and Development Branch (ARDA) the province shares equally with the Federal Government the cost of rural development. In Ontario, ARDA is heavily committed to farm enlargement and consolidation, capital grants for farm development, retraining and research programs, development of community pastures where farmers rent pasture at cost, and soil, water and forest conservation projects.

Agricultural Manpower Services assists in recruiting, moving and placing farm workers during the planting and harvesting seasons. This service operates under the Provincial Agricultural Manpower Agreement negotiated each year by the Federal Government and the provincial governments.

The Co-operative Loans Board makes loans to agricultural co-operative associations for the construction of cold storages, feed mills, processing plants, grain elevators, potato storages, dairies, creameries and cheese factories.

The Crop Insurance Commission of Ontario, a Branch of the Department, provides insurance against weather, insect and disease damage to winter wheat, spring grain, forage crops, grain corn, soybeans and white beans. Premium rates are subsidized 25 p.c. by the Federal Government and 5 p.c. by the Ontario Government.

The Soils and Crops Branch conducts programs of applied research to provide farmers with specific recommendations for their areas. Soils and crops specialists frequently work with local branches of the Ontario Soil and Crop Improvement Association to relay this information to the farmers. The specialists also supervise the county weed inspectors who enforce the Weed Control Act.

The programs of the Veterinary Services Branch fall into the categories of service and regulation. Services include administration of a mastitis control program, a certified herd policy for swine and veterinary assistance for designated areas (mostly in the northern districts); the Regulatory Division administers the Meat Inspection Act, the Brucellosis Act 1965, the Animal Contagious Diseases Act, the Livestock Community Sales Act, the Dead Animal Disposal Act, the Rabies Indemnification program, the Mastitis Control program and the Animals for Research Act. The Branch provides diagnostic services for livestock and poultry producers at five regional laboratories.

The Live Stock Branch supervises numerous livestock improvement programs and administers the Warble Fly Control Act, the Artificial Insemination Act, the Dog Tax and Live Stock and Poultry Protection Act, and the Hunter Damage Compensation Act. Livestock improvement programs include dairy herd improvement; beef cattle performance testing; quality meat sire policy; bull, boar and ram premium policies; production testing in sheep and the federal-provincial sheep transportation assistance policy; and northern Ontario livestock assistance. The Branch sponsors and endorses the Ontario Beef Cattle Improvement Association and the county and district associations, makes grants available to regional livestock clubs that hold sales of good quality breeding stock, and sponsors exhibits of livestock outside the province.

The Ontario Stock Yards Board, which operates under the Federal Livestock and Livestock Products Act, was established to provide a marketing service for Ontario livestock producers and to protect their bargaining power.

The Ontario Milk Commission, a Branch of the Department, is responsible for dairy programs. Under the Milk Act, 1965 and through the Ontario Milk Marketing Board and the Ontario Cream Producers' Marketing Board, the Commission is responsible for all producer marketing of milk and cream in the province. The Ontario Milk Marketing Board directs milk from farm to plant and establishes prices. The Commission administers the Farm Products Payments Act, 1967, the Oleomargarine Act, and the Edible Oil Products Act. It also carries out the milk quality program, audits plant records, supervises the fluid milk, milk products and central milk testing programs. The Infra Red Milk Analyzer (IRMA) is the only recognized method for determining milk fat content in Ontario. The Commission licenses processors and distributors, carries on extension work with producers, operates milk-testing laboratories for the purpose of calculating producer returns, certifies butter and cheese makers, graders and testers, and does inspection work on farm and in plant.

The Farm Products Inspection Branch promotes improved methods of disease control, grading, packaging, marketing, handling, storing and transporting Ontario farm produce. This is provided for under the Farm Products Grades and Sales Act and Regulations and the Plant Diseases Act.

Under the Ontario Farm Products Marketing Board, a Branch of the Department of Agriculture and Food, 19 producer boards market 37 commodities with a total market value of approximately \$500,000,000 annually.

The Ontario Food Council Branch of the Department has the broad responsibility of finding methods to better co-ordinate marketing of Ontario farm products in Ontario, other Canadian provinces and abroad. The Council includes representatives of producers, processors, wholesalers, distributors and consumers. Market development, import replacement, and expanding food information and consumer affairs services are major areas of the Council's work. The Ontario Food Terminal, operating under the Ontario Food Terminal Act, offers farmers the services of one of the largest volume wholesale fruit and vegetable markets in Canada.

Research and education are administered by the Education and Research Division of the Department. Under the Division, the Agricultural Research Institute of Ontario recommends and co-ordinates research for the betterment of agriculture, veterinary medicine and household science, undertakes continuous research on crops, livestock and farming practices, and administers a number of services. Horticultural research is co-ordinated by the Horticultural Research Institute of Ontario, which also operates under the Education and Research Division. Fruit and vegetable product development research, and fruit and vegetable variety research are the chief functions of the Institute. The Provincial Pesticide Residue Testing Laboratory tests samples of animal, vegetable and mineral origin for herbicides, fungicides and insecticides. The Laboratory continually tests milk collected from Ontario farms for pesticide residues. The Division is also responsible for five diploma-course programs at the Ontario Agricultural College at the University of Guelph, and at the Colleges of Agricultural Technology at Centralia, Kemptonville, New Liskeard and Ridgeway.

The Provincial Entomologist reports on insect control programs, as provided under the Plant Diseases and Abandoned Orchards Act, to determine pest control recommendations for Ontario crops. The Provincial Apiarist is responsible for reporting on the bee and honey industry.

There are 54 county and district Extension Branch offices to serve Ontario farmers. These are staffed by agricultural representatives who relay information about agricultural research developments directly to farmers. In addition, specialists on farm management and engineering are located strategically throughout the province. The northern Ontario assistance policies of the Department, which vary from year to year, are also administered by the Branch. The Branch endorses and assists the 4-H Clubs and the Junior Farmers' Association of Ontario.

The Home Economics Branch conducts an extension program for rural women's groups and for girls' 4-H home-making clubs. The senior program deals with the study of foods, nutrition, clothing, textiles, home furnishings, home crafts and home management.

The Information Branch publishes and distributes several hundred publications covering most areas of agriculture in Ontario, as well as home gardening and homemaking. News releases, radio tapes and television are used to convey information on important changes in agriculture to farmers. Its film library distributes more than 2,000 films annually to the public.

The Agricultural and Horticultural Societies Branch advises and offers financial assistance to agricultural and horticultural societies and ploughmen's associations throughout the province and administers the Community Centres Act which authorizes grants to municipalities for capital investments in community centres and recreational facilities.

The Ontario Telephone Service Commission provides technical and management advice to the 66 Independent Telephone Systems (municipal and privately owned) operating in rural Ontario.

The Farm Economics, Co-operatives and Statistics Branch does research into marketing, policy, production, land use, and dairying; works with the Dominion Bureau of Statistics to collect and publish statistics on farm production and marketing; and provides services to various Ontario agricultural co-operatives.

Manitoba.—The Department of Agriculture serves Manitoba through the following branches.

The Extension Service Branch deals with rural extension education generally and has specialists devoting attention particularly to agricultural engineering, entomology and beekeeping, radio, TV and information, 4-H Clubs and women's work, manpower and rural development. Meetings, field days, and short courses are held; 39 agricultural representatives and four assistants are located in 37 offices in the province, each serving from one to five municipalities, four manpower extension agents serve the Interlake region, and 15 home economists serve designated areas.

The Animal Industry Branch develops and administers policies that encourage the improvement and efficient production of different classes of livestock, including poultry, supervises the grading of cream and inspects dairy manufacturing plants. Several Acts to promote high quality products for consumer protection are administered in co-operation with federal departments.

The Soils and Crops Branch encourages the development, production and improvement of cereal, forage and special crops and horticulture and promotes proper land use through soil conservation programs. The Branch develops and administers policies that encourage good field crop husbandry, soil conservation, land development and weed control.

The Economics and Publications Branch deals with agricultural economics, supervises the farm business clubs and publishes and distributes annually approximately 250,000 bulletins, circulars, posters, leaflets, etc. The Branch is responsible for publishing provincial agricultural statistics and maintains an agriculture reference library.

The Co-operative Services Branch registers and supervises co-operatives and credit unions and administers the Acts governing them. It also collects and compiles statistics on co-operative activity throughout the province. Producer marketing boards and Marketing Commissions under the Natural Products Marketing Act are also served and administered through this Branch.

The Veterinary Services Branch provides a diagnostic laboratory for animal diseases; administers the Veterinary Services District Act and the Veterinary Science Scholarship Fund Act; and works in close co-operation with practising veterinarians and the federal Health of Animals Branch in the control of livestock and poultry diseases.

Saskatchewan.—The Saskatchewan Department of Agriculture is composed of the following branches and services.

The Agricultural Extension Branch is the main extension agency of the Department and has the primary objective of maintaining and increasing the over-all efficiency of agricultural production. To that end it provides a basic extension program designed to: (1) ensure that the most modern farming techniques and the latest research findings are made available to farmers; (2) provide leadership and general guidance in agricultural adjustment programs needed to bring about necessary social and economic progress; and (3) co-ordinate and administer field programs and policies sponsored by other branches for the purpose of encouraging desirable adjustments in agricultural production and to cope with emergency situations. The Branch endeavours to maintain close co-operation with other branches of the Department as well as with the University of Saskatchewan and the Canada Department of Agriculture in the three-way co-ordination of agencies known as the co-operative extension program.

The Production and Marketing Branch is comprised of three major Divisions—Animal Industry, Plant Industry and Veterinary. The first two provide specialist services to

agricultural representatives and agriculture in field crops, weed and insect control, soil conservation, horticulture, apiculture, livestock and poultry, and administer related Acts and programs. The Veterinary Division administers the Veterinary Service District Act and Calhhood Vaccination Program, provides laboratory services and co-operates with the Federal Government and local veterinarians in disease prevention and control.

The Conservation and Development Branch provides engineering services and some financial assistance for irrigation development programs and water utilization and control projects. Land reclamation and development and the construction of provincial community pastures also come within its jurisdiction.

The Lands Branch administers Crown land, except forest reserves and parks in settled areas, classifies it according to the use for which it is best suited and disposes of it under lease or sale. The Branch also secures land control for land utilization projects, supervises new settlement projects, pays for clearing and breaking by farmers on provincial leases, operates provincial community pastures and operates training farms for people of Indian ancestry.

The Family Farm Improvement Branch gives farmers technical advice on farm buildings, farmstead planning, mechanization and materials handling. The Branch conducts research for farm water and sewage works, provides technical and financial assistance for their installation and administers the Agricultural Implements Act.

The Economics and Statistics Branch undertakes research and investigations required to formulate and evaluate policies and programs that will ensure a high level of growth and efficiency in Saskatchewan's agriculture; it collects, analyses and distributes economic information. The Farm Management Division carries out an extension program in farm business management. Data on crop conditions, production, marketings and income are available from the Statistics Division.

Alberta.—The Alberta Department of Agriculture has seven Divisions whose activities are co-ordinated by an Executive Committee made up of the seven Directors, the Deputy Minister and his executive assistant.

The Plant Industry Division administers programs and policies relating to crop improvement, crop protection and pest control, weeds, soils and fertilizers, horticulture, apiculture and special projects. It operates a crop clinic in Edmonton, a horticultural research station at Brooks and an extensive tree nursery at Oliver, which supplies millions of trees yearly for farm planting and for reforestation.

The Animal Industry Division administers legislation, policies and programs in the broad area of livestock, dairy and poultry production and in processing and marketing. Included are: setting standards for and approving public sales of sires, ROP programs for beef cattle, swine and sheep, extension programs for all classes of stock, administering standards and qualifications for the artificial insemination (AI) industry; supervising feeder associations; brand registration and inspection; licensing of butchers, livestock dealers, stockyards and AI technicians; pound districts and sale of horned cattle. The testing, grading and purchasing of raw produce by all dairy plants are under regulation, as are standards of construction, manufacture, processing, sanitation and temperature control for dairy and frozen-food plants. A regular cow-testing service to provide the basis for breeding, feeding and culling dairy cattle is available to dairy producers, and chemical and bacteriological analyses are conducted for industrial directives. Licences are issued to poultry hatcheries, wholesalers, first receivers and truckers, and programs are conducted for control of pullorum-typhoid diseases of chicken- and turkey-hatching egg supply flocks; extension programs, cost studies, disease tests and surveys, and research projects with respect to poultry are also carried out.

The Veterinary Services Division provides diagnoses of livestock and poultry diseases and conducts investigations of disease conditions; provides lecture service for the University of Alberta and for other groups; promotes policies aimed at reducing losses such as vibriosis

control, stockyard inspection, swine health programs and mastitis; administers the licensing of live fur bearing animals and pelts; and assists fur farmers in care, management and stock improvement.

The Extension Section of the Extension and Colleges Division co-ordinates the extension programs of every Division of the Department of Agriculture. In association with other extension agencies, it assumes leadership in the formulation and implementation of District and regional programs for agriculture, family living and community development. The four Extension Branches operate mainly through 54 District Extension Offices co-ordinated and supervised by six regional agriculturists, and complemented by an expanding staff of regional specialists in livestock, plant industry, engineering and home economics. Leadership training is also provided. The Information Branch is in charge of extension through mass media. It distributes bulletins, pamphlets, building plans, releases, timely articles and news material to the press, conducts radio programs five days a week over 10 radio stations and takes an increasing part, both directly and indirectly in the production of television programs on all phases of agriculture and home-making.

Agricultural and vocational colleges are operated at Olds, Vermilion and Fairview, all three offering five courses in agriculture—a general course, or majors in plant science, animal science, agricultural mechanics and farm management. They also offer a complete business course. Special short courses offered at one or the other of the colleges include land appraisal and assessment, artificial insemination, welding and motor mechanics, irrigation technology, pesticide applicators, building materials merchandising, automation technology, dairy production and custodial housekeeping.

The Agricultural Economics Division provides extension information on farm management, credit and marketing to aid farmers in instituting good business practices on the farm; collects, analyses and disseminates agricultural statistics in collaboration with the Dominion Bureau of Statistics; conducts studies on farm production costs and returns, marketing, and resource and rural development; and provides advisory assistance on economic matters to government departments, the agriculture industry and farm groups. Credit is made available to farmers for the purchase of land under the Farm Purchase Credit Act and for home improvements under the Farm Home Improvement Act.

The Water Resources Division administers legislative control over the province's water resources and all functions connected with the allocation, apportionment, and distribution of surface and ground water. Its basic responsibility is to foster an orderly development of available water supplies to meet all the foreseeable needs of the province. Thus, the Division is responsible for Alberta's large-scale water conservation and development program known as "The Prairie Rivers Improvement and Management Evaluation" (PRIME), embodying major water diversion and storage areas for the transfer of water from areas of surplus to areas of deficiency. Divisional programs include: (1) design and construction activities on water control, water development and conservation when it is in the public interest to do so; (2) inventory, distribution and magnitude of surface and ground water; (3) land development planning for irrigation purposes and the management and use of water as it relates to agricultural production; and (4) activities related to seepage and salted land reclamation, development and improvement of irrigation practices, and determination of the physical characteristics of soils relevant to the soil water phenomena.

The Program Development Division administers the ARDA and related rural development programs, the Conservation and Utilization Branch, including the land assembly program, the farm adjustment and consolidation program, the land improvement and conservation program, the renewable resources research program, the Utilization of Lands and Forests Act and the Canada Land Inventory. Other Branches of the Division include the Agricultural Products Marketing Council, which establishes and regulates marketing boards and commissions to assist in the marketing of agricultural products; the Municipal Agricultural Programs Branch, which assists in programs carried out by local authorities, administers the federal-provincial manpower agreements, and assists in the administration and achievement of objectives of agricultural societies; and the Irrigation Secretariat, which

administers, for the Irrigation Council, the Alberta Irrigation Act in the areas of administration, operation, maintenance, and reconstruction of irrigation projects and districts in the province.

British Columbia.—The Department of Agriculture comprises four Divisions—Administrative Services, Production Services, Special Services and General Services. Administrative Services is responsible for the direction of policies affecting farmers' institutes, grants, accounts, personnel and publications. Production Services includes the Apiary, Dairy, Field Crops, Horticulture, Livestock, Poultry, Farm Management and 4-H Clubs Branches, and district agriculturists. Special Services includes the Animal Pathology, Engineering, Entomology, Markets and Statistics, Soils, Veterinary and Plant Pathology Branches. The remainder—Agricultural Rehabilitation and Development Act (ARDA), Information Service, British Columbia Marketing Board, British Columbia Milk Board and the Crop Insurance Branch—are grouped under General Services.

In addition to the headquarters staff at Victoria, the Department maintains 19 district offices in various parts of the province, as well as a veterinary laboratory and poultry-testing station at Abbotsford, a beef-testing station at Kamloops and dairy and entomology laboratories at Vancouver and Cloverdale, respectively. Soil-testing facilities are installed at Kelowna and Victoria.

Subsection 2.—Agricultural Schools, Colleges and Universities

All of the provinces of Central and Western Canada have agricultural colleges in association with universities that give courses leading to degrees in agricultural science and home economics and also provide postgraduate courses; the University of British Columbia has a faculty of Agricultural Sciences; Ontario, Quebec and Saskatchewan have veterinary colleges. In addition, all of these provinces have schools of agriculture or diploma courses that provide basic training for young people intending to return to farms or interested in employment in businesses allied with agriculture.

In Alberta, these programs are offered at the vocational, technician and technologist levels by three agricultural and vocational colleges which also engage in applied agricultural research and offer programs in adult education and upgrading (see p. 570).

In the Maritime Provinces, training in scientific agriculture is available at colleges in Prince Edward Island and Nova Scotia where courses leading to third-year admission to degree courses elsewhere are given. Vocational and short courses are available in all three provinces. All colleges of agriculture engage in research and extension activities.

Section 4.—Statistics of Agriculture*

The collection, compilation and publication of statistics relating to agriculture is a responsibility of the Dominion Bureau of Statistics. Valuable information is obtained through the Censuses of Canada, through partial-coverage mailed questionnaire surveys and from the administrative records of government operations.

The Bureau collects and publishes primary and secondary statistics of agriculture on an annual and monthly basis. The primary statistics relate mainly to the reporting of crop conditions, crop and livestock estimates, wages of farm labour and prices received by farmers for their products. The secondary statistics relate to farm income and expenditure, per capita food consumption, marketing of grain and livestock, dairying, milling and sugar industries and cold storage holdings. In the collection of annual and monthly statistics, the Canada Department of Agriculture and various provincial departments, as well as such agencies as the Board of Grain Commissioners and the Canadian Wheat Board, contribute statistical data to the Bureau and aid directly in DBS survey work. Many thousands of

* Revised in the Agriculture Division, Dominion Bureau of Statistics.

farmers throughout Canada send in reports voluntarily and dealers and processors also provide much valuable data. The figures contained in this Section do not include estimates for Newfoundland; agriculture plays a relatively minor part in Newfoundland's economy and commercial production of most agricultural products is quite small. In the following Subsections, details are given for 1969 with earlier comparisons; figures for the latest year are subject to revision and it should be noted that many of those given for earlier years have been revised since the publication of the 1969 Year Book.

Subsection 1.—Income from Farming Operations

Cash Receipts from Farming Operations.—Estimates of cash receipts from farming operations include data concerning cash receipts from the sale of farm products, Canadian Wheat Board participation payments on previous years' grain crops, net cash advances on farm-stored grains in Western Canada, deficiency payments made by the Agricultural Stabilization Board, and supplementary payments. Farm cash receipts from the sale of farm products include the returns from all sales of agricultural products except those associated with direct inter-farm transfers. The prices used to value all products sold are prices to farmers at the farm level; they include any subsidies, bonuses and premiums that can be attributed to specific products but do not include storage, transportation, processing and handling charges which are not actually received by farmers.

Total cash receipts from farming operations for 1969, excluding supplementary payments, are estimated at \$4,195,600,000 for Canada (excluding Newfoundland). This estimate is 3.7 p.c. below the value of \$4,355,200,000 obtained in 1968 but 3.4 p.c. above the average for the five years 1964-68. This decrease in cash receipts can be attributed for the most part to lower returns from wheat and Canadian Wheat Board participation payments being only partially offset by increased receipts from the sale of most of the items included in livestock and livestock products.

While the Maritime Provinces, Quebec and Ontario showed increases in total cash receipts ranging from 3.7 p.c. in Ontario to 14.6 p.c. in Nova Scotia, estimates for the Prairie Provinces and British Columbia were lower than for 1968. The greatest decline occurred in Saskatchewan where total cash receipts fell by almost 20 p.c.; in Manitoba and Alberta the decrease was 3.3 p.c. and 8.9 p.c., respectively, and in British Columbia it was only 1.8 p.c.

¹ See text below.

In addition to the above income, farmers received supplementary payments amounting to \$9,900,000 compared with \$8,000,000 in 1968. The 1968 payments consisted entirely of those made under the Prairie Farm Assistance Act* but in 1969 payments to sugar beet

* Payments to farmers under the Prairie Farm Assistance Act are made from the Prairie Farm Emergency Fund to which farmers contribute by means of a 1-p.c. levy on grain marketings.

growers in Ontario were also included. Thus, farm cash receipts from farming operations and supplementary payments totalled \$4,205,500,000 in 1969, an amount 3.6 p.c. below the estimated \$4,363,200,000 in 1968.

Field Crops.—During 1969, farmers' total returns from the sale of field crops, cash advances on farm-stored grains in Western Canada and Canadian Wheat Board payments amounted to \$1,479,400,000, 14.7 p.c. below the 1968 level of \$1,734,800,000. This estimate represents about 35 p.c. of farmers' total cash receipts from farming operations, a fairly large decline from the almost 40-p.c. share in 1968. The decline was caused mainly by considerably lower Canadian Wheat Board participation payments on previous years' grain crops and lower returns from the sale of wheat.

With both marketings and average initial prices of wheat below those prevailing in the previous year, 1969 returns from this source fell by slightly more than \$125,000,000, a decline of 20.8 p.c. Although average prices of oats and barley at time of delivery were also lower than in 1968, increased marketings of both grains more than offset the lower prices, resulting in larger returns to the farmer. The average price received for flaxseed was also lower than in 1968 but a very large increase in marketings caused receipts to rise from \$26,400,000 in that year to \$57,000,000 in 1969. Returns to rapeseed producers were higher in 1969 than in 1968; higher prices and increased marketings resulted in cash receipts rising from \$33,200,000 to \$50,500,000. Smaller increases were registered for corn, sugar beets and tobacco but receipts from potatoes rose from \$61,300,000 to \$67,000,000.

Canadian Wheat Board participation payments on previous years' wheat, oat and barley crops declined markedly in 1969 from 1968. For wheat, payments fell from \$315,300,000 to \$60,200,000; for oats, from \$8,400,000 to \$4,800,000; and for barley, from \$35,900,000 to \$3,500,000. This decline was caused by smaller total final payments on the 1967 crop relative to those made in 1968 on the 1966 crop. The smaller payments reflect a reduction in the per-bushel payments and the marketings on which the payments are made.

Livestock and Livestock Products.—Farmers' cash receipts from the sale of livestock and livestock products in 1969 amounted to \$2,603,000,000, an increase of 4.8 p.c. over the 1968 level of \$2,483,400,000. Lower marketings of cattle and calves in the later year were only partly offset by higher prices and cash receipts declined from \$980,400,000 in 1968 to \$969,600,000. Although hog marketings were also down, higher average prices brought receipts up to \$461,300,000 from \$409,900,000 in 1968, an increase of 12.5 p.c. Both sales and prices of eggs were higher in 1969 than in the previous year so that returns to egg producers went up 15 p.c. to \$188,400,000. Poultry meat receipts rose to \$249,600,000, more than \$20,000,000 above the 1968 level; average prices differed only slightly for the two years but marketings in 1969 were higher. Both quantity marketed and average prices for dairy products rose during 1969, increasing returns to dairy producers by 5.1 p.c. to \$676,900,000. In addition, dairy producers received supplementary payments amounting to \$86,900,000, which was 20.7 p.c. below the \$109,700,000 received in 1968. Cash receipts from sheep and lambs showed a small increase from \$8,700,000 to \$8,800,000.

Farm Net Income.—Two different estimates of farm net income from farming operations are prepared by DBS. *Realized net income* is obtained by adding together farm cash receipts from farming operations, supplementary payments and the value of income in kind, and deducting farm operating expenses and depreciation charges; this estimate represents the amount of income from farming that operators have left for family living, personal taxes and investment after provision has been made for operating expenses and depreciation charges. *Total net income* is obtained by adjusting realized net income to take into account changes occurring in inventories of livestock and stocks of grains on farms between the beginning and end of the year; this estimate is used in calculating the contribution of agriculture to national income and for making comparisons with net income of non-farm business enterprises.

For 1969, the estimated realized net income of farm operators from farming operations amounted to \$1,379,500,000, 10 p.c. below the 1968 value of \$1,532,800,000 and 11.8 p.c. below the 1964-68 average value of \$1,564,800,000. During 1969, the 3.6-p.c. decrease in farm cash receipts and the higher farm operating expenses were only partially offset by increased income in kind and supplementary payments.

The 1969 estimate of total net income, which takes into account changes in farm inventories, amounted to \$1,688,400,000, 3.1 p.c. below the 1968 level of \$1,743,100,000 but 4.9 p.c. above the 1964-68 average of \$1,609,400,000. The decrease in cash receipts resulted mainly from lower returns from wheat and Canadian Wheat Board participation payments being only partially offset by increased receipts from the sale of most of the items included in livestock and livestock products. The gain in the value of inventory change for 1969 can be attributed to substantial additions to farm-held stocks of grains and a build-up in the numbers of livestock on farms. Supplementary payments were also higher in 1969 and operating expenses continued to rise.

In 1969, operating expenses and depreciation charges reached a new high level of \$3,429,100,000, a figure 1.8 p.c. above the 1968 value of \$3,367,100,000. Farmers' outlays were higher in all provinces except Manitoba and Saskatchewan. For Canada as a whole, gross farm rent, fertilizer and lime, "other" livestock expenses, repairs to buildings, and the miscellaneous category all showed decreases over the previous year. Most noticeable was the decline in outlays for fertilizer and lime which were quite substantial in the Prairie Provinces and only a little less so in Ontario; there was a considerable fall in the quantity purchased and prices were lower. Estimates of gross farm rents were down by 4.7 p.c. compared with 1968, a drop caused by lower values of cash and share rents in the Prairie Provinces. The size of the hired farm labour force was reduced in the latter part of 1969 but, because wage rates rose to a new high, the outlay for wages to farm labour reached slightly more than \$300,000,000. Higher rates of interest and an expanded use of capital led to a further increase in total interest payments. Machinery expenses as a whole moved up by about \$20,000,000 to a record \$554,400,000. Outlays for machinery repairs increased in all provinces except Saskatchewan and the Maritimes. The general decline in feed prices was more than offset by a slight increase in the quantity purchased and outlays rose by 4.9 p.c. from \$528,500,000 in 1968 to an estimated \$554,500,000 in 1969. Expenses incurred in repairing buildings together with electricity and telephone bills varied very little between the two years. Depreciation charges on farm buildings and machinery, which rose in 1969, are intended to reflect the amount that farmers would have to pay to accommodate the decline in the value of farm buildings and machinery due to obsolescence and wear.

9.—Net Income of Farm Operators from Farming Operations, by Item and by Province, 1965-69

(Exclusive of Newfoundland)

NOTE.—Includes estimated rental value of farm homes, supplementary payments made under the provisions of the Prairie Farm Assistance Act and payments under the Western Grain Producers' Acreage Payment Regulations.

Subsection 2.—Volume of Agricultural Production

The index of physical volume of agricultural production for Canada (1949=100) is estimated at 179.7 for 1969, about 5 p.c. above the 1968 estimate of 171.1. This is the second highest point on record, being exceeded only by the 1966 index of 183.3. Greater

production of grain crops in 1969, particularly in Saskatchewan, was the main contributor to the increase over 1968, which also reflected lesser gains in output of poultry meat, eggs and dairy products.

Increased over-all production was limited to four provinces—Prince Edward Island, Nova Scotia, Quebec and Saskatchewan—most of it occurring in Saskatchewan as a result of larger grain crops and some gain in output of poultry products. In the two Maritime Provinces, production was up for livestock, poultry meat and dairy products, and egg production was also higher in Nova Scotia. The gain in Quebec was attributable to increased output of poultry meat and dairy products.

The greatest percentage decline in total production took place in Manitoba where an almost 10-p.c. drop resulted from lower production of wheat and oats; this decline was offset to some extent by an increase in the output of livestock and poultry products. In British Columbia, output was down about 5 p.c.; in that province, there were some increases in output of poultry meat, eggs and potatoes but declines for grains, livestock and fruits. Production in New Brunswick was down 3 p.c. because reduced output of potatoes and livestock more than offset higher production of poultry meat. In Ontario, the over-all decline was 1.5 p.c.; there, production was up for hogs, poultry meat, eggs and fruits but down for grain, potatoes and cattle. Farmers in Alberta produced about 1 p.c. less in 1969 than in 1968; lower production of grains and dairy products slightly more than offset gains in potatoes, poultry meat and eggs.

The index has been developed as an index of unduplicated gross farm production and, in its construction, provision was made to avoid double-counting of farm output. Within a province, such double-counting could occur when feed grains, credited to field crop production, are fed to livestock and appear later as livestock and livestock products. Inter-provincially, this duplication could occur when feed grains produced in one province are fed in another, and when feeder cattle raised in one section of the country are shipped to another for finishing.

10.—Index Numbers of Physical Volume of Agricultural Production, by Province, 1960-69

(1949=100. Exclusive of Newfoundland)

NOTE.—For a description of the index, methods and coverage, see DBS publication *Index of Farm Production 1966* (Catalogue No. 21-203).

Subsection 3.—Field Crops*

The 1969 index of field crop production for Canada (1949=100) was 196.7, the second highest level on record. It was substantially above the 1968 index of 181.4 but remained below the record of 203.0 achieved in 1966. In Manitoba, the estimated field crop production resulted in an index of 160.6, down from the record 183.6 obtained in 1968; the Saskatchewan production index, at 259.1, was well above the 1968 level of 196.4 but short of the

* The supply and disposition of the major Canadian grains is dealt with in Chapter XXI, Pt. I, Sect. 2, under the heading of "The Grain Trade, 1968-69 and 1969-70".

record 274.2 set in 1966; and the index for Alberta was 239.8 compared with 229.8 in 1968 and the record of 252.1 set in 1966. The 1969 field crop production indexes for the eastern provinces compared quite closely with those of 1968. The Ontario index was 160.5 compared with the 1968 record figure of 167.1; the Quebec index at 128.4 was slightly below the 1968 index of 128.7 and a little more below the 1967 record of 132.0; and in Prince Edward Island, Nova Scotia and New Brunswick the 1969 indexes were 114.1, 55.7 and 86.3, respectively, compared with 116.6, 55.7 and 97.4, respectively, in the preceding year.

Canada's 1969 wheat crop, estimated at 684,300,000 bu., was some 5 p.c. above the 1968 crop of 649,800,000 bu. The average yield at 27.4 bu. per acre was 24 p.c. above the 1968 yield of 22.1 bu. and 31 p.c. above the 10-year (1958-67) average of 20.9 bu. The average protein content of the 1969 crop of hard red spring wheat was 13.9 p.c., unchanged from the level of the previous year but above the 13.6 p.c. average for the wheat crops of the past 20 years.

Supplies of Canadian feed grains (corn, oats, barley, rye, mixed grains and buckwheat) in the crop year 1969-70 amounted to 1,301,500,000 bu., some 16 p.c. above the 1968-69 total of 1,122,500,000 bu. All feed grains except corn contributed to the increase, as well as higher opening stocks of oats, barley, rye and corn. Supplies of oats (Aug. 1, 1969 carryover of 128,700,000 bu. plus a crop of 371,400,000 bu.) totalled 500,100,000 bu., 14 p.c. higher than the previous year's total of 439,500,000 bu.; supplies of barley, at a record 577,800,000 bu. (carryover of 199,400,000 bu. plus a crop of 378,400,000 bu.), were 27 p.c. above the 1968-69 total of 456,300,000 bu.; supplies of rye at 25,200,000 bu. were 22 p.c. above the 1968-69 total of 20,500,000; and the 1969 crops of mixed grains reached an estimated 87,300,000 bu. Production of grain corn, on the other hand, was 73,400,000 bu., 10 p.c. below the 1968 record of 81,200,000 bu.

Acreages, yields and prices of the principal field crops in the three years 1967-69, with averages for 1962-66, are shown in Table 11; acreages, yields and values of field crops by province for 1968 and 1969, with averages for 1963-67, in Table 12; and acreages and production of grain in the Prairie Provinces for the years 1964-69 in Table 13.

Stocks of Canadian Grain.—Table 14 shows the stocks of Canadian grain on hand in Canada and in the United States on July 31 for the years 1966-69, with averages for the five-year periods 1956-60 and 1961-65. Stocks in Canada are separated into those in commercial positions and those on farms. Stocks on farms and in country elevators in the Prairie Provinces are given separately.

14.—Carryover of Canadian Grain as at July 31, 1966-69, with Averages for 1956-60 and 1961-65

Subsection 4.—Livestock and Poultry

Livestock.—The downward trend in the number of livestock on farms and the upward trend in value per head, in evidence over the past few years, continued in 1969 as indicated in Table 15. The only increase in that year over 1968 was in the number of hogs on farms, which moved upward in all provinces except Quebec, Alberta and British Columbia. Quebec reported some increase in number of milk cows in both 1968 and 1969, and Nova Scotia, Ontario and Saskatchewan showed slight increases in numbers of sheep.

Cattle marketings through commercial channels in 1969 decreased 4.2 p.c. from 1968, calf marketings 10.4 p.c. and hog marketings 8.2 p.c. Sheep and lamb production continued downward, the decline in 1969 amounting to 19.6 p.c. However, offsetting the over-all reduction in production of livestock were the sharp rises in prices for all classes, regardless of grade, which produced an increase of 10 p.c. in sales revenue and brought the total value of commercial marketings to \$1,422,000,000, an all-time record. Most classes of livestock were marketed at heavier weights and at somewhat better quality than in 1968. Despite a very limited export trade throughout the year, the strength of the domestic demand was such that supplies were never burdensome and good weekly clearances were generally the rule.

The all-markets average price received in 1969 for all classes and grades of cattle was \$26.65, an amount \$3.45 per cwt. higher than in 1968. Good feeder steers averaged \$31.20, an increase of \$4.50 over 1968, and good stock steer calves averaged \$37.55, or \$7.55 above 1968. Hog carcasses averaged \$57.40 against \$46.35 in 1968; despite the reduction in marketings, the heavier weights at which hogs were slaughtered and the sharp increase in value per head brought about \$53,000,000 more than in the preceding year. The total value of commercial marketings approximated \$423,100,000, an all-time record. The weighted average price of good lambs for all Canada was \$30.45 compared with \$26.85 in the previous year, an increase fairly representative of all trading centres.

The Canada Department of Agriculture inspects all livestock in plants designated as inspected establishments under the Meat and Canned Foods Act. A record is kept of these inspections and figures from 1960 are given in Table 16. Local wholesale butcherings and slaughterings carried out by retail butchers and by farmers for their own use are not included. Actually, the slaughtering and meat packing industry is concentrated in a comparatively small number of large establishments to facilitate greater efficiency and utilization of products; thus, the figures of Table 16 are fairly inclusive.

Additional information on livestock marketings is given in Chapter XXI, Pt. I, Sect. 2, under the heading of "Livestock Marketings".

Subsection 5.—Dairying

The numbers of dairy cattle on farms have generally been declining gradually for many years; Quebec is the exception among the provinces in this respect, having increased its stock of milk cows by nearly 50,000 in the 1966-69 period. Despite the over-all decrease in numbers, the total milk production in Canada has been kept at a fairly static level by an increased output per cow. Production is concentrated in Central Canada, the provinces of Quebec and Ontario accounting for about 74 p.c. of the total quantity. Of the total output in 1969, 65 p.c. was used for factory-made dairy products, 27 p.c. was sold in fluid form and 8 p.c. was used for all purposes on farms.

¹ Used in farm butter only.

The farm value of milk production in Canada for 1969 was \$742,631,000, 4.5 p.c. higher than in 1968. The value of milk used in factories in 1969 was \$374,153,000 (65 p.c. of the total milk production) and fluid sales, \$302,679,000 (27 p.c. of the total).

The 350,000,000 lb. of creamery butter produced in 1969 accounted for 43.8 p.c. of the national milk output, and was 4.2 p.c. higher than in 1968. Per capita consumption was 15.28 lb., three quarters of a pound lower than in 1968. Quebec is the largest producer of creamery butter, having accounted for nearly half of the total output in 1969; Ontario followed with 28 p.c.

Both output and consumption of cheese have been gradually increasing during the past few years. The total production of factory cheese (Table 21) for 1969 was 207,000,000 lb. compared with 199,000,000 lb. for 1968, and per capita consumption of all varieties of cheese, excluding cottage cheese, was 11.19 lb., compared with 10.34 lb. for 1968. Exports of all cheese, mostly cheddar, amounted to 35,958,000 lb. in 1969, compared with 44,261,000 lb. in 1968. Of the total output of factory cheese in 1969, Ontario accounted for 52 p.c. and Quebec for 41 p.c.

There has been a generally decreasing trend in the output of concentrated whole milk products, including condensed milk, evaporated milk, whole milk powder, partly skimmed evaporated milk and others, but the production of concentrated milk byproducts has moved upward during the past few years. The latter category comprises condensed skim milk, evaporated skim milk, skim milk powder, powdered buttermilk, whey powder, casein and other milk byproducts, but by far the major component is skim milk powder which accounts for over 80 p.c. of the total production. Thus, the recent rise in output of concentrated milk byproducts was mainly attributed to this commodity, production of which increased from 222,155,000 lb. in 1965 to 394,558,000 lb. in 1969.

Milking time for Holstein-Friesians on a dairy farm. Since 1881, Canadian breeders have been improving the already excellent characteristics of the Holstein-Friesian. The average performance of the breed in Canada is 12,243 lb. of milk and 457 lb. of butterfat in 305 days. In health and productive efficiency, Canadian dairy cattle form one of the major world sources of breeding stock.

As indicated in Table 24, the estimated total consumption of fluid milk and cream, on a milk basis, has decreased slightly over the past three years and the per capita consumption has continued the slow decline in evidence over the past two decades. In fact, total and per capita domestic disappearance of all dairy products, as shown in Table 25, is also gradually decreasing.

¹ Includes Newfoundland for all manufactured dairy products.

² Includes, in addition to the items listed, malted milk, cream powder, partly skimmed evaporated milk, whole milk powder of less than 26-p.c. fat, formula milk, evaporated milk of 2-p.c. fat, and concentrated liquid milk.

³ Includes, in addition to the items listed, condensed buttermilk, powdered buttermilk, sugar of milk, casein, powdered whey, special formula skim milk products, lactalbumin and concentrated liquid skim milk. Since the quantities used for human consumption and livestock feeding cannot be separated, per capita figures include both.

⁴ Includes ice cream mix in terms of milk.

Subsection 6.—Fruits, Vegetables and Other Farm Products

Fruits.—Commercial fruit growing in Canada is confined almost exclusively to rather limited areas in the Provinces of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia. Nova Scotia production is centred mainly in the Annapolis Valley and New Brunswick production in the St. John River Valley and Westmorland County. In Quebec the fruit growing districts are the Montreal area, the North Shore area, the Eastern Townships and the Quebec City district. Ontario fruit is grown in all the counties adjacent to the St. Lawrence River and the Great Lakes as far west as Georgian Bay, the Niagara district being the most productive. In British Columbia the four well-defined fruit areas are the Okanagan Valley, the Fraser Valley, the Kootenay and Arrow Lakes district and Vancouver Island. The climate elsewhere in Canada is not generally suitable for commercial tree-fruit culture. Apples and small fruits are produced commercially in the provinces named but tender tree fruits and commercial vineyards are largely limited to Ontario and British Columbia.

By far the most valuable fruit crop produced in Canada is apples and in 1968 the farm value for this crop was \$39,947,000. The main outlet for Canadian apples is the fresh market which absorbs about 70 p.c. of the production each year and the volume of apples for processing is about 30 p.c. of production. In Nova Scotia nearly 70 p.c. of the crop is processed; lesser quantities are processed in other producing provinces.

Strawberries are grown commercially in all provinces for which tree-fruit statistics are prepared, as well as in Prince Edward Island, but are produced over a somewhat wider area than are tree fruits. Raspberries are grown commercially in Nova Scotia, New Brunswick and Quebec but the bulk of the crop is produced in Ontario and British Columbia. The Fraser Valley of British Columbia is the most important producing area. Wild blueberries

Some 300 high school students from a nearby city help with the strawberry harvest on an Ontario farm. Many berries are sold as fresh fruit but much of the crop goes to commercial processors to be frozen, canned or made into jams and jellies. In 1969, 22,959 tons of strawberries were harvested across the country.

are harvested on a commercial scale in Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick and Quebec. This crop is indigenous to certain areas in these provinces and a large percentage of the crop is frozen and exported. There is also some production of cultivated blueberries, particularly in British Columbia.

A marketing system has been developed for distributing fresh fruit from the specialized production areas to all parts of the country and a large proportion of the deciduous fruit consumed in Canada is grown domestically. Considerable quantities of apples, strawberries and blueberries are exported. Canning and processing industries have developed in the fruit growing districts and, although the importance of the processing market varies with different fruits, it provides a valuable outlet for substantial proportions of most Canadian-grown fruit crops.

Tables 26 and 27 show the estimated commercial production of fruit, by province and by kind, for 1967-69.

Vegetables.—Estimates of acreage and production of commercial vegetables in Canada are prepared for all provinces except Newfoundland and Saskatchewan. Ontario is the largest producer, followed by Quebec and British Columbia. A wide variety of crops is grown in these three provinces and a somewhat smaller range in the Maritimes and in the Prairie Provinces.

Canning, freezing and processing of vegetables are carried on in the important producing areas. The estimates in the following tables cover output of commercial growers for processing and for sale on the fresh market but do not include averages or production of vegetables grown for home use on farms and elsewhere.

Tobacco.—Canada produces several types of leaf tobacco but by far the most important is the flue-cured or Bright Virginia type. This is grown mainly in Ontario, along with considerable quantities of burley and smaller amounts of dark (air-cured and fire-

cured) tobacco. Quebec produces smaller quantities of these types as well as some cigar and pipe tobacco and small flue-cured acreages are also harvested in Prince Edward Island, Nova Scotia and New Brunswick. Although acreages planted were lower in 1969 than in 1968, yields per acre in all producing areas were higher, resulting in an increase in production from 218,807,000 lb. to 247,465,000 lb. The average value per pound decreased in 1969 to 65.8 cents from 70.3 cents.

Data on the production of cigarettes for domestic consumption are no longer available. However, on the basis of domestic sales reported to DBS by manufacturers, the consumption of cigarettes increased to 46,582,210,000 in 1969 from the 46,270,233,000 sold in 1968.

¹ Includes other types not specified.

Eggs.—Egg production in 1969 at 471,231,000 doz. was 4.0 p.c. higher than in 1968 and 5.0 p.c. higher than the record 448,200,000 doz. produced in 1959. The number of layers increased slightly in 1969 over 1968, the rate of lay per 100 layers rose to 20,602 from 20,380 and the farm selling price of eggs averaged 43.0 cents per doz. compared with 37.8 cents. The three Maritime Provinces produced 7.0 p.c. of all eggs in 1969; Quebec, 16.4 p.c.; Ontario, 38.2 p.c.; the Prairie Provinces, 24.4 p.c.; and British Columbia, 12.3 p.c.

¹ Total laid less loss.

Wool.—Table 33 gives the estimated production and apparent consumption of wool in Canada for the years 1965 to 1969. It should be noted that the estimates for 1967, 1968 and 1969 are not strictly comparable with those of previous years because they exclude the output of pulled wool which is now produced by fewer than three firms and, according to the provisions of the Statistics Act, cannot be shown. Canada produces only between 7 p.c. and 8 p.c. of domestic wool requirements.

33.—Production and Apparent Consumption of Wool, 1965-69

² See text above.

Honey.—As shown in Table 34, honey production in 1969 increased 60 p.c. over 1968. Average production per colony was 127 lb. compared with 81 lb. in 1968.

Honey is produced commercially in all provinces except Newfoundland and yields vary considerably from year to year. In 1969, Alberta was the largest producer, surpassing Manitoba, the next largest producer, by 11,030,000 lb. Honey bees are kept in some fruit growing districts for pollination purposes and are also used for pollination of certain seed crops.

To facilitate storage, shipment and uniformity of quality, large quantities of Canadian honey are pasteurized. Beekeepers' marketing co-operatives are active in several provinces. In 1969, Canada exported 4,795,426 lb. of honey valued at \$1,036,000, mainly to Britain, France, the United States and West Germany.

Sugar Beets and Beet Sugar.—Sugar beets are grown commercially in Quebec, Ontario, Manitoba and Alberta and beet sugar factories are located in these provinces. In Quebec, commercial production is centred in the St. Hilaire area of the Eastern Townships; in Ontario, production is confined to the southwestern section of the province. Alberta produces the largest crop and in that province sugar beets are grown under irrigation.

Maple Sugar and Maple Syrup.—Maple syrup is produced commercially in the Provinces of Nova Scotia, New Brunswick, Quebec and Ontario. The bulk of the crop comes from the Eastern Townships of Quebec, a district famous both in Canada and in the United States as the centre of the maple products industry. Virtually all of the maple products exported go to the United States with the larger proportion moving as sugar, although substantial quantities of syrup are also shipped. Much of the syrup sold in Canada is marketed in one-gallon cans direct to the consumer from the producer but a considerable amount of both sugar and syrup is sold each year to processing firms.

Greenhouse Operations.—Annual surveys are made of greenhouse operations. Resulting figures are based on data reported by firms and individuals returning questionnaires, with the exception of that for cucumbers and tomatoes grown in Essex County of Ontario (the most important producing area), which are based on information obtained from the local co-operative marketing agency. Only greenhouses used for the production of items for sale are included in the survey.

² Excludes Newfoundland and Prince Edward Island.

Subsection 7.—Prices of Agricultural Products

The monthly index of farm prices of agricultural products was designed to measure changes occurring in the average prices farmers receive at the farm from the sale of farm products. In comparing current index numbers with those prior to August 1969, the following points should be considered. Prices of all western grains used in the construction of the index prior to that date are final prices; all later figures are initial prices only for wheat, oats and barley. Any subsequent participation payments will be added to the prices currently used and the index revised upward accordingly.

39.—Average Index Numbers of Farm Prices of Agricultural Products, by Province, 1963-69, and Monthly Indexes for 1968 and 1969

(1961=100)

NOTE.—A description of this index, its coverage and the methods used will be found in DBS *Quarterly Bulletin of Agricultural Statistics* (Catalogue No. 21-003) for July-September 1969.

Subsection 8.—Food Consumption

Food consumption figures represent available supplies, including production and imports, adjusted for change of stocks, exports, marketing losses and industrial uses. All calculations are made at the retail stage of distribution, except for meats for which the figures are worked out at the wholesale stage. The amount of food actually eaten would be somewhat lower than indicated because of losses and waste occurring after the products reach the hands of the consumer.

All basic foods are classified under 12 main commodity groups. The total for each group is computed using a common denominator for the group, for example: milk solids (dry weight) for the dairy products group; fat content for fats and oils; and fresh equivalent for fruits. All foods are included in their basic form, that is, as flour, fat, sugar, etc., rather than in more highly manufactured forms.

The series in Table 42 represents the official estimates of yearly supplies of food moving into consumption, expressed in pounds per capita, for the years 1963-67 as an average for comparison with the years 1968 and 1969.

42.—Per Capita Supplies of Food Moving into Consumption 1968 and 1969, with Average for 1963-67

Kinds of Food and Weight Base	Pounds per Capita per Annum			Percentages of 1963-67 Average

Coffee..... Green beans	8.9	9.7	9.3	109.0	104.5

¹ Fluctuations in apparent per capita flour consumption are caused partly by lack of complete data on flour inventories in all positions. ² Information on processed potatoes is not available. ³ Tomatoes canned, tomato juice, tomato pulp, paste and purée, and ketchup. ⁴ Includes process cheese. ⁵ Cream powder, included with whole milk powder, too small to be expressed. ⁶ Includes cream expressed as milk. ⁷ Includes evaporated and condensed skim milk, condensed buttermilk, sugar of milk, formula skim milk products, concentrated liquid skim milk and lactalbumin.

Disappearance of Meats and Lard.—Production of meats from slaughter in Canada, total supply, distribution and per capita disappearance of meats and lard are shown in Table 43. All estimates are on a cold carcass-weight basis except canned meats, which are in terms of product.

¹ Quantity small; included with beef.² Trimmed of larding fat and excluding offal.³ Includes commercial lard production and estimated lard equivalent of renderable pork fat available from all uninspected slaughter.⁴ Due to changes in lard source data, comparable 1969 information is not available.

Section 5.—Agricultural Statistics of the Census

Changes occurring in the agricultural industry are revealed by the results of the Census of Agriculture taken every five years. Details of the latest census are published in Volumes III, IV and V of the 1966 Census of Agriculture. For certain analyses of the census results, reference may be made to the 1968 and 1969 Canada Year Books; summary information relating to use of agricultural land, farm capital, farm tenure, farm mechanization and labour, and types of farms is given at pp. 516-523 of the 1969 edition and additional information on types of commercial farms, economic classification of farms, tenure and age of farm operators and farm electrification is given in the 1968 edition at pp. 528-533. Only data on number and area of farms and on size of census-farms are carried in this Section.

The term *census-farm*, which is used in the following paragraphs, refers to an agricultural holding of one acre or more in size with sales of agricultural products during the 12 months preceding the census date of \$50 or more. Census-farms having sales of \$2,500 or more during the preceding year are described as *commercial farms*.

Number and Area of Farms.—There were fewer census-farms in Canada in 1966 than in 1961, the number dropping 10.5 p.c. from 480,903 to 430,522. A decrease was shown in each province, the highest proportionate drop being 26.1 p.c. in New Brunswick and the lowest 2.5 p.c. in Newfoundland. On a regional basis, the trend was most pronounced in the Atlantic region where the decrease was 21.0 p.c. and least pronounced in the Prairie region where it was 7.4 p.c.

Although farm numbers were lower, the total area of census-farms was almost 1 p.c. higher, increases in the Prairie region and British Columbia more than offsetting decreases in the Atlantic and Central regions. Thus, while the number of census-farms in the Prairie region decreased 7.4 p.c., the farm area increased 2.8 p.c. Similarly, in British Columbia the number of farms decreased 4.3 p.c. but farm area increased 17.4 p.c.

44.—Number and Area of Census-Farms and Commercial Farms, by Province, Census of 1961 and 1966

Of the 430,522 census-farms in 1966, 276,835 were classed as commercial, representing an increase over 1961 of nearly 7 p.c. There were more commercial farms in every province except Nova Scotia and New Brunswick but 75 p.c. of the increased number were located in the Prairie region. Commercial farms comprised 64.3 p.c. of all census-farms in 1966 but accounted for 81.5 p.c. of the agricultural land; in 1961 the proportions were 53.9 p.c. and

73.1 p.c., respectively. The total area of all commercial farms was 12.5 p.c. higher in 1966 than in 1961, an increase to which every province contributed. The largest percentage increase in area occurred in British Columbia and the largest increase in acreage occurred in Saskatchewan.

Size of Census-Farms.—During the 1961-66 period the average size of census-farms continued the previously observed rising trend, increasing by 45 acres from 359 to 404 acres; the average size over the 1951-66 period increased by 125 acres. On a provincial basis, the 1961-66 change varied from a decrease of two acres in Newfoundland to an increase of 77 acres in Saskatchewan. On a regional basis, the Prairies had the largest increase, from 617 to 685 acres, contrasted with the Central region where the increase was only from 151 to 161 acres.

The number of census-farms of 760 acres or more increased between 1961 and 1966 but those of under 760 acres declined. The pattern is generally similar in all provinces—the number of smaller holdings tends to decrease while the number of larger ones increases, although there is considerable variation among various size groups between provinces. Manitoba, Saskatchewan and Alberta, where the trend toward larger farms is more pronounced than in other provinces, also show slight increases in number of census-farms falling into the two smaller size groups—under nine acres and 10-to-69 acres.

For Prince Edward Island, Nova Scotia, New Brunswick, Quebec and Ontario the predominant size group is still the 70-to-239-acre group, even though there has been a drop in the number of census-farms in this category. The 240-to-399-acre group is the predominant one in the Prairie Provinces, but in Saskatchewan almost as many census-farms fall into the 400-to-559, 560-to-759 and 760-to-1,119-acre groupings as in the 240-to-399-acre category. In British Columbia the largest number of census-farms is in the 10-to-69-acre group. More than half of the census-farms in Newfoundland are under nine acres in size.

Section 6.—International Crop Statistics

Tables 46 and 47 are based on estimates published by the Foreign Agricultural Service, United States Department of Agriculture, and give the acreages and production of wheat and the production of oats and barley for the harvests of 1968 and 1969 with average for the years 1960-64, in the leading countries of the world.

46.—Estimated Acreages and Production of Wheat Harvested in 1968 and 1969 in Specified Countries, with Average for 1960-64

NOTE.—Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow.

*The interpretation of the symbols used in the tables throughout the Year Book
will be found on p. vii of this volume.*

Canada's extensive forests have been an invaluable asset to the country and its people since the earliest days of settlement. The productive portion of these forests has poured increasing wealth into the stream of national income, contributing to the economy of the country as the producer of raw materials for industry and as the source of livelihood for hundreds of thousands of persons. Perhaps in no other country is the national wealth so dependent upon its forest resources and the success of its forest industries as in Canada.

The present annual forest harvest of some 3,900,000,000 cu. feet of roundwood supports a highly complex and diversified domestic and export industry. The forest industries (which include the logging industry, the wood industries and the paper and allied industries) provide about 300,000 man-years of employment and pay out more than \$1,700,000,000 annually in salaries and wages. In addition, a considerable number of people derive part of their income from farm woodlot operations, etc. The forests support a large number of sawmills and wood-using plants which in many cases are located in small towns and villages and contribute appreciably to the local economies. The sale of forest products abroad represents about one fifth of the value of Canada's export trade.

The predominant part played by the pulp and paper, lumber, and other forest products industries in the development of the country has, in the past, resulted in a widespread tendency to evaluate the forest in terms of timber alone. There is now a growing realization of the value of the forest in assuring an adequate supply of good-quality water, in providing for sport and recreation, in guarding against erosion, and in maintaining a habitat for wildlife. The increasing recognition of these forest values is fostering a broader and more realistic concept of forestry.

The Canadian forest industry as a whole recorded a substantial increase in productivity over the years 1961-68 inclusive, the total estimated "value added" (value of shipments less cost of materials and fuel) advancing from \$2,000,000,000 to \$3,200,000,000; in 1967, the value added by the forest industry, which was \$3,166,000,000, comprised 11 p.c. of the total for all goods-producing industries.

* Sections of this Chapter that deal with forest resources and depletion and the federal forestry program were revised by the Canadian Forestry Service of the Department of Fisheries and Forestry, Ottawa. Provincial forestry programs were prepared by the forestry officials of the respective provincial governments. Sections dealing with forest and allied industries, except as otherwise noted, were revised in the Forestry Section, Manufacturing and Primary Industries Division, Dominion Bureau of Statistics.

During this period, roundwood production moved up 25 p.c. from 3,175,000,000 to 3,970,000,000 cu. feet. The increase was more than accounted for by roundwood produced for industrial purposes, since that produced for non-industrial purposes, such as fuelwood and wood for charcoal, declined. Lumber shipments rose from about 8,216,000 to 11,000,000 M ft. b.m. At the present time, British Columbia sawmills account for about two thirds of all shipments of lumber in Canada and more than 60 p.c. of it is exported, mainly to the United States. The production of wood pulp also rose substantially, increasing 42 p.c. to nearly 17,000,000 tons in 1968. Although the most important component of this total continued to be groundwood pulp, 7,100,000 tons of which were produced primarily in Ontario, Quebec and the Atlantic Provinces, output of sulphate pulp increased by 124 p.c. over the period to 6,100,000 tons. British Columbia produced most of the sulphate pulp and it was in British Columbia, too, that the largest part of the increase in pulp output occurred. Pulp exports over the period increased from 24 p.c. to almost 30 p.c. of total production. At present, about two thirds of these exports go to the United States.

Production of basic paper and paperboard also rose over the 1961-68 period, increasing 30 p.c. to reach 11,183,000 tons. About 71 p.c. of the 1968 total came from Ontario and Quebec and 15 p.c. from British Columbia. Newsprint, made chiefly in Ontario and Quebec, is the most important paper commodity manufactured in Canada, followed in order by paperboard and book and writing papers. In 1968, pulp and paper exports made up 13 p.c. of the value of all Canadian exports and, once again, the United States was the principal market for these commodities.

The value of factory shipments from veneer and plywood mills was 100 p.c. higher in 1968 than in 1961. In the earlier year, about 60 p.c. of the value of output (\$129,300,000) was accounted for by British Columbia Douglas-fir veneer and plywood but by 1967 this proportion had dropped to 56 p.c. On the other hand, plywood manufactured from other British Columbia softwoods increased. Hardwood veneer and plywood made primarily in Ontario and Quebec from poplar, birch and maple accounted for 36 p.c. of the value of all factory shipments in 1961 and for 33 p.c. in 1968. Of the total value of exports of veneer and plywood, amounting to \$86,000,000 in 1968, Douglas-fir plywood accounted for over \$45,000,000, about 71 p.c. of it going to Britain.

Section 1.—Forest Resources

Forest Regions.*—The forests of Canada cover a vast area in the north temperate climatic zone but wide variations in physiographic, soil and climatic conditions cause marked differences in their character; hence, eight fairly well-defined forest regions may be recognized. These regions and their relative sizes are as follows:—

<i>Region</i>	<i>Percentage of Forest Area</i>	<i>Region</i>	<i>Percentage of Forest Area</i>
Boreal.....	82.1	Acadian.....	2.0
Great Lakes-St. Lawrence.....	6.5	Columbia.....	0.8
Subalpine.....	3.7	Deciduous.....	0.4
Montane.....	2.3		
Coast.....	2.2	TOTAL.....	100.0

Boreal Forest Region.—This Region comprises the greater part of the forested area of Canada. It forms a continuous belt from Newfoundland and the Labrador coast westward to the Rocky Mountains and northwestward to Alaska. White Spruce and Black Spruce are characteristic species; other prominent conifers are Tamarack which generally ranges throughout, Balsam Fir and Jack Pine in the eastern and central portions, and Alpine Fir and Lodgepole Pine in the western and northwestern parts. Although the Boreal forests are primarily coniferous, there is a general admixture of deciduous trees such as White Birch

* A more detailed discussion of forest regions is given in Bulletin 123, *Forest Regions of Canada*, published by the Canadian Forestry Service of the Department of Fisheries and Forestry, Ottawa.

and poplar; these are important in the central and south-central portions, particularly along the edge of the prairie. In turn, the proportion of spruce and larch increases to the north and, with the more rigorous climate, the close forest gives way to an open lichen-woodland which finally changes into tundra. In the eastern section, along the southern border of the Region, there is a considerable intermixture of species from the Great Lakes-St. Lawrence forest, such as Eastern White Pine, Red Pine, Yellow Birch, Sugar Maple, Black Ash and Eastern White Cedar.

Great Lakes-St. Lawrence Forest Region.—Extending inland from the edges of the Great Lakes and the St. Lawrence River lies a forest of a very mixed nature which is characterized by Eastern White Pine, Red Pine, Eastern Hemlock and Yellow Birch. With these are associated certain dominant broadleaved species common to the Deciduous Forest Region, including Sugar Maple, Red Maple, Red Oak, Basswood and White Elm. Other species with wide ranges are the Eastern White Cedar and Largetooth Aspen and, to a lesser extent, Beech, White Oak, Butternut and White Ash. Boreal species such as White Spruce, Black Spruce, Balsam Fir, Jack Pine, poplars, and White Birch are intermixed, and Red Spruce is abundant in certain central and eastern portions. This Region extends in a westward direction into southeastern Manitoba but does not include the area north of Lake Superior.

Subalpine Forest Region.—This is a coniferous forest located on the mountain uplands of Alberta and British Columbia, from the Rocky Mountain range through the interior of British Columbia to the Pacific Coast inlets. The characteristic species are Engelmann Spruce, Alpine Fir and Lodgepole Pine. There is a close relationship between the Subalpine Forest Region and the Boreal Forest Region, which also shares Black Spruce, White Spruce and Trembling Aspen. There is also some penetration of Interior Douglas-fir from the Montane forest, and Western Hemlock, Western Red Cedar and Amabilis Fir from the coastal forests. Other species are Western Larch, Whitebark Pine, Limber Pine and, on the Coast Mountains, Yellow Cypress and Mountain Hemlock.

Montane Forest Region.—The Region occupies a large part of the interior uplands of British Columbia, as well as a part of the Kootenay Valley and a small area on the east side of the Rocky Mountains. It is a northern extension of the typical forest of much of the western mountain system in the United States, and comes in contact with the Coast, Columbia, and Subalpine Forest Regions. Ponderosa Pine is a characteristic species of the southern portions. Interior Douglas-fir is found throughout, but more particularly in the central and southern parts; Lodgepole Pine and Trembling Aspen are generally present, the latter being particularly well represented in the north-central portions. Engelmann Spruce and Alpine Fir from the Subalpine Forest Region, together with White Birch, are important constituents in the northern parts. White Spruce, although primarily Boreal in affinity, also grows here. Extensive prairie communities of bunch-grasses and herbs are found in many of the river valleys.

Coast Forest Region.—This Region is part of the Pacific Coast forest of North America. Essentially coniferous, it consists principally of Western Red Cedar and Western Hemlock, with Sitka Spruce abundant in the north and Douglas-fir in the south. Amabilis Fir and Yellow Cypress are represented throughout the Region and, together with Mountain Hemlock and Alpine Fir, are common at the higher altitudes. Western White Pine is found in the southern parts, while Western Yew is in widely scattered groups. Deciduous trees, such as Black Cottonwood, Red Alder and Bigleaf Maple, have a limited distribution. Arbutus and Garry Oak grow only on the southeast coast of Vancouver Island, the adjacent islands and mainland. The Arbutus is a broadleaved evergreen. Both are species whose centres of population lie southward in the United States.

Acadian Forest Region.—Over the greater part of the Maritime Provinces (excluding Newfoundland) there is a forest closely related to the Great Lakes–St. Lawrence forest and, to a lesser extent, to the Boreal forest. Red Spruce is a characteristic though not exclusive species, and associated with it are Balsam Fir, Yellow Birch and Sugar Maple, with some Red Pine, Eastern White Pine and Eastern Hemlock. Beech was formerly a more important forest constituent than at present, but beech bark disease has drastically reduced Beech representation in Nova Scotia, Prince Edward Island and southern New Brunswick. Other species of wide distribution are White Spruce, Black Spruce, Red Oak, White Elm, Black Ash, Red Maple, White Birch, Grey Birch and poplars. Eastern White Cedar, although present in New Brunswick, is extremely rare elsewhere and Jack Pine is apparently absent from the upper St. John Valley and the western half of Nova Scotia.

Columbia Forest Region.—A large part of the Kootenay Valley, the upper valleys of the Thompson and Fraser Rivers and the Quesnel Lake area of British Columbia contain a coniferous forest, called the Columbia Forest Region, which closely resembles the Coast Forest Region. Western Red Cedar and Western Hemlock are the characteristic species in this interior “wet belt”. Associated trees are the Interior Douglas-fir which has general distribution and, in the southern parts, Western White Pine, Western Larch, Grand Fir and Western Yew. Engelmann Spruce from the Subalpine Forest Region is important in the upper Fraser Valley and is found to some extent at the upper levels of the forest in the remainder of the Region. At lower elevations in the west and in parts of the Kootenay Valley, the forest merges into the Montane Forest Region and in a few places into prairie grasslands.

Deciduous Forest Region.—A small portion of the deciduous forest, which is widespread in the United States, extends into southwestern Ontario between Lakes Huron, Erie and Ontario. Here, with the deciduous trees common to the Great Lakes–St. Lawrence Forest Region, such as Sugar Maple, Beech, White Elm, Basswood, Red Ash, White Oak and Butternut, are scattered a number of other deciduous species which have their northern limits in this locality. Among these are the Tulip-tree, Cucumber-tree, Pawpaw, Red Mulberry, Kentucky Coffee-tree, Redbud, Black Gum, Blue Ash, Sassafras, Mockernut Hickory, Pignut Hickory, Black Oak and Pin Oak. In addition, Black Walnut, Sycamore and Swamp White Oak are confined largely to this Region. Conifers are few but there is scattered distribution of Eastern White Pine, Tamarack, Eastern Red Cedar and Eastern Hemlock.

The Grasslands.—Although not a forest region, the prairies of Manitoba, Saskatchewan and Alberta support several species of trees in great numbers. Trembling Aspen forms groves or “bluffs” around wet depressions, and continuous dense stands along the northern boundary. Several other species of poplar are usually found along rivers and in moist locations, along with willows and some White Spruce. There are sporadic stands of White Birch, Manitoba Maple, Bur Oak and ash. In British Columbia, where the grasslands are confined to deep valleys and low areas of the interior, there are scattered representations of Ponderosa Pine, birches, poplars, spruce and Mountain Alder.

Forest Land.*—The forest area of Canada is estimated at 1,710,788 sq. miles, about 56 p.c. of which is “productive” in the sense that it is capable of producing merchantable timber; the remainder is incapable of producing merchantable timber because of adverse climatic, soil or moisture conditions or is reserve forest land for which no inventories are available. Table 1 shows the areas of productive and non-productive forest land in each province and territory; forest land in each province classified by type of growth is given in Chapter X at p. 544.

* The figures given in this section will be affected by the results of more recent forest inventories that have been conducted by the provinces; later data will be available from the Canadian Forestry Service by mid-1971.

Canada.....	959,849	750,939	1,710,788

Inventories of the forest resources are made periodically by provincial forest authorities and, with their co-operation, the Canadian Forestry Service of the Department of Fisheries and Forestry compiles national statistics. The latest estimates of the total stand of merchantable timber, by province and region, appear in Table 2. These estimates are subject to constant revision as more accurate and complete inventories are compiled.

(units of 85 cu. ft.).

² Four to nine inches

Tenure of Forest Land.—Corporations and private individuals own 9 p.c. of the productive forest land of Canada and 91 p.c. is in the possession of the Crown in the right of the federal or the provincial governments. Rights to cut Crown timber under lease or licence have been granted on 23 p.c. of the productive forest land; the remainder comprises unalienated productive forest areas and federal lands such as Indian reserves, military reserves, etc.

Woodlots on the 430,522 farms (1966) across the country comprise about 3 p.c. of the total productive forest. These small wooded tracts, ranging in size from three or four acres to 200 or more acres, are among the most accessible forests in Canada. Also, the woodlots of Eastern Canada are, in general, highly productive because they lie in the southern part of the country and frequently occupy soils that are considerably higher in quality than those typical of the northern forests.

3.—Tenure of Occupied Productive Forest Land, by Province

¹ Includes 16 sq. miles of "other" provincial Crown land. ² Of this total, 320 sq. miles are under lease or licence—293 sq. miles in Alberta, the 25 sq. miles in the Yukon Territory and the 2 sq. miles in the Northwest Territories.

Canada's Forest Trees.—There are approximately 140 recognized tree species in Canada,* excluding the various subspecies and varieties. Of this number, 31 species are conifers or 'softwoods', about two thirds of which are of commercial value; less than one fifth of the native broadleaved trees or 'hardwoods' can be considered as commercially significant.

The most abundant forest trees in Canada, in terms of standing timber, are the spruces, pines, true firs, poplars, hemlocks, birches, cedars, Douglas-fir, maples and larches. However, the economic importance of these species, except for the spruces, does not necessarily correspond to their abundance.

About one third of Canada's timber volume is spruce. White Spruce and Black Spruce range from the Atlantic Coast almost to the Pacific and northward into Alaska. Sitka Spruce, the largest of the native spruces, is found in the Pacific Coast area; Engelmann Spruce is established farther inland, extending to the foothills of the Rockies in southwestern Alberta; and Red Spruce is found only in Eastern Canada. Spruce wood is used extensively for pulpwood, lumber and plywood.

Among the pines two species—Jack Pine and Lodgepole Pine—comprise 11 p.c. of Canada's standing timber. Jack Pine grows from Nova Scotia to northern Alberta and the

* See *Native Trees of Canada*—7th Edition, Information Canada, Ottawa, 1969.

Northwest Territories and Lodgepole Pine is found in western Alberta, British Columbia and Yukon Territory. Eastern White Pine, which grows from the Atlantic to the eastern edge of the prairies, and Western White Pine produce valuable softwood lumber. Ponderosa Pine, found in the drier areas of southern British Columbia, and Red Pine, found in Eastern Canada, are important commercial species.

The four native firs are all commercial species, although Balsam Fir far outranks the other species in this regard. It is the only fir found in Eastern Canada and ranges from Newfoundland through all the provinces except British Columbia. Alpine Fir, essentially a high altitude tree, is found over a wide area in British Columbia and its range extends well into the western half of central Alberta and the Yukon. Amabilis Fir is a West Coast species, while Grand Fir is found both in the Pacific coastal areas and in the interior of British Columbia. Fir is commonly cut as pulpwood and, to a lesser extent, as sawlogs.

Douglas-fir, one of Canada's best known commercial trees, is not a true fir. The tree responsible more than any other for British Columbia's world-wide reputation for timber is the coastal form of Douglas-fir which is dominant in the forests of the province's lower coastal areas. An interior form, known as Blue Douglas-fir, is used on a large scale for lumber, plywood, construction timbers, piling and kraft pulp.

The poplars are the most abundant of the native broadleaved trees. They include Trembling and Largetooth Aspen, Balsam Poplar, and the three cottonwoods. The most widely distributed is Trembling Aspen, followed by Balsam Poplar; both species occur from Newfoundland to Alaska. The largest of the native poplars is Black Cottonwood; its range covers the lower two thirds of British Columbia and extends well into Alberta to the east in a pattern that follows the natural drainage basins. It also reaches as far north as the Yukon along the coast. This species is in demand for veneer stock. Other cottonwoods—Eastern Cottonwood and its western form known as Plains Cottonwood, and Narrowleaf Cottonwood—have a much narrower distribution.

Hemlocks, ranking fifth in volume of standing timber, have considerable commercial importance. Western Hemlock grows plentifully along the Pacific Coast and west of the Rockies in the interior wet belt of British Columbia. It is one of the principal timber-producing species in Western Canada and is also an important source of pulpwood. Eastern Hemlock is found from the Atlantic to western Ontario, although not in a wide or continuous pattern. It is used to produce a number of products including pulpwood, plywood and lumber. Mountain Hemlock is found in British Columbia in parts of the coastal forest and in the heavier rainfall areas of the interior.

Of the six native birches, only two are of commercial importance—Yellow Birch and White Birch. Most abundant is White Birch which grows over a vast part of Canada from the Atlantic to the Pacific and extends up to the northern tree limit. One variety, Western Paper Birch, reaches heights of 100 feet and diameters of three feet or more. Yellow Birch is a valuable hardwood species used extensively for flooring, veneer and plywood. Its range reaches from the Atlantic to Lake Superior.

The native trees commonly known as 'cedars' include the Arbor-Vitae (Eastern White Cedar and Western Red Cedar), Yellow Cypress (Yellow Cedar) and a juniper (Eastern Red Cedar). Together they make up an important group of commercial species. Eastern White Cedar is found from Nova Scotia to Manitoba and as far north as James Bay in Quebec and Ontario. Its wood, which is light and resistant to decay, is used for posts, poles, boats and other purposes where timber is exposed to situations favourable to decay. Western Red Cedar is of major importance in British Columbia where it ranges from the Pacific Coast to the Rocky Mountains. It is used for lumber, exterior siding, shingles, poles and posts, doors, window sashes and other purposes where resistance to decay is required. Yellow Cypress—commonly called Yellow Cedar or Alaska Cedar—is found mainly in the Pacific Coast region where it grows down to sea level in the more northerly sections. As it extends farther south, it seeks higher elevations. Its wood, like that of the other cedars, is valued in situations where resistance to decay is needed.

There are ten native species of maple, six of which are of commercial value. Only two species are known as hard maples, producing wood that is both hard and strong—Sugar Maple and the closely related Black Maple. Sugar Maple ranges from the Atlantic to Lake Superior, while Black Maple is found mainly in southern Ontario. Hard maple constitutes one of the most valuable commercial hardwoods in Canada. It is used for furniture, flooring, veneer, quality plywood, turnery and other specialized purposes where strength and hardness are needed. Sugar Maple and, to a lesser degree, Black Maple are tapped for the maple sugar industry. Bigleaf Maple is found on the lower Pacific Coast mainland and on Vancouver Island. The wood is only moderately hard and lacks strength but, owing to the limited local supply of hardwoods, this tree is of some importance for furniture and other specialized uses in the immediate area. Red Maple and Silver Maple are eastern species. Red Maple ranges from Newfoundland to western Ontario, while Silver Maple is concentrated mainly in southern Ontario and southwestern Quebec. Their wood is weaker and softer than that of the hard maples and these trees are not important timber producers. The Manitoba Maple, ranging from Ontario across the southern parts of Manitoba, Saskatchewan and southeastern Alberta, produces a soft, moderately light wood that is low in strength. It is better known as a shelterbelt tree.

There are three species of larch in Canada. Two of them—Eastern Larch, better known as Tamarack, and Western Larch—have commercial value. Tamarack is widely distributed from Newfoundland to the British Columbia-Yukon border and reaches far into the Northwest Territories. The wood is used for poles, posts, piling, boxes, crates and pulp. Western Larch, found mainly in southeastern British Columbia, is one of the important timber-producing trees of Western Canada. The wood, being hard and strong, is used mainly in construction but is also made into flooring, interior and exterior furnishings, and pulp.

Other trees of less commercial significance include oak, ash, beech, elm and basswood. Valuable as the wood of these species may be, it is usually obtainable in limited quantities only. However, the species may have considerable local importance and they also contribute greatly to the forest landscape.

Canada's total forest wealth is measured by the diversity as well as by the abundance of its trees. The better known species are the commercially exploited trees, but in the forest all species have a role to play in maintaining the ecological balance, controlling water run-off and preventing soil erosion, and also in providing a habitat for native fauna and recreational facilities for all who wish to enjoy them.

Section 2.—Forest Depletion

General information on forest depletion and increment as well as statistics on forest fires and fire losses are presented in this Section. The scientific control of the influences that account for wastage, such as forest fires, insect pests, etc., is dealt with in Section 4.

Table 4 shows only the depletion of the forests caused by utilization and by fire. Information on the extent of damage caused by agencies other than fire, such as insects, disease and natural mortality, is not available. Losses from insects and diseases alone are estimated to be in excess of 1,000,000 M cu. ft. of merchantable timber annually.

The productive forests of Canada covering an area of 959,849 sq. miles constitute the reserve from which forest production will be obtained in the immediate future. The supply of merchantable timber on this area is estimated at 748,982,000 M cu. ft. and the average annual utilization in 1957-66 of 3,384,000 M cu. ft. therefore represented less than one half of one percent of the supply. However, it should be noted that utilization does not occur evenly throughout the productive forest area but is concentrated on the relatively small area of occupied forest land (land under lease, licence or private ownership). Thus, overcutting may occur on many of these occupied areas, emphasizing the need for orderly management of all commercial forests if the forest industries are to maintain their important position in the Canadian economy. Also, efficient utilization of cut timber is an important factor related to forest depletion.

4.—Forest Utilization and Depletion by Fire, Ten-Year Average 1957-66

Item	Usable Wood	Percentage of Total Depletion
	'000,000 cu. ft.	
Products Utilized—

By forest fires.....	469	12.2
Totals, Depletion.....	3,853	100.0

Forest Fire Statistics.—The number of forest fires reported in Canada during 1968 was substantially lower than that in the previous year—7,301 compared with 8,650. However, despite the lower fire incidence, most categories of forest fire statistics exceeded the corresponding ten-year averages. The 2,211,605 acres burned in 1968 were slightly below the ten-year average of 2,473,346 but the value of the forests destroyed, at \$21,604,794, was 47 p.c. higher. Similarly, the cost of fire fighting, which amounted to \$11,896,326 in 1968, was 50 p.c. higher than the 1958-67 average of \$7,938,772.

A regional breakdown of 1968 forest fire statistics indicates that, of all regions, Alberta experienced the most severe fire season. Although only 8.5 p.c. of the fires occurred in that province, it accounted for 45 p.c. of the area burned and 59 p.c. of the fire fighting costs and damages. It is significant to note that only 1,384 fires, or 19 p.c. of the 7,301 reported, were attributed to lightning compared with 2,055 or 27 p.c. of the 1961-67 average of 7,558.

5.—Forest Fire Losses, 1968, compared with Ten-Year Average 1958-67

Section 3.—Statistics of Forest and Allied Industries

This Section is concerned with the many industries engaged in the felling of timber and its transformation into a great variety of products required in modern living. The extensive forests of Canada provide raw materials for several large and growing primary industries, i.e., the sawmills and planing mills, the shingle mills, the veneer and plywood mills, the particle board plants and the pulp and paper mills, which in their turn provide raw materials for a wide range of secondary industries that convert the products of the primary industries into more highly manufactured goods such as sash, doors, millwork, wooden boxes, furniture, converted papers and paper goods, etc. However, much of the output of the primary forest industries is exported; the sawmill industry and the pulp and

paper industry, especially, contribute substantially to the value of the export trade of Canada and thereby provide an important part of the foreign exchange necessary to pay for the imports from other countries.

Statistics of manufacturing activity and total activity of the wood industries and the paper and allied industries may be found in a number of tables in Chapter XVI on Manufactures.

Subsection 1.—Logging Industry

The forests of Canada provide the raw materials for its sawmills and planing mills, shingle mills, veneer and plywood mills, particle board plants and pulp and paper mills as well as roundwood for export in unmanufactured state and other products such as fuelwood, poles and piling, fence posts, mining timber, Christmas trees, etc. Tables 8 and 9 give the estimated quantities of wood cut in Canada, by province and by type of product. In estimating the annual cut, certain factors have been used to convert commercial units to cubic feet. These are as follows (British Columbia estimates are supplied by the British Columbia Forest Service):—

Product		Equivalent Volume in Cubic Feet		
		British Columbia Coast	British Columbia Interior	Other
Logs and bolts.....	M ft.b.m.	166.6	173.9	200
Pulpwood.....	cord	80	80	85
Fuelwood.....	"	80	80	80

Subsection 2.—Wood Industries

The standard industrial classification subdivides the wood industries group into the following industries: sawmills and planing mills, shingle mills, veneer and plywood mills, sash, door and other millwork plants, hardwood flooring mills, wooden box factories, the coffin and casket industry and miscellaneous wood industries. The latter item is further subdivided into the wood preservation industry, the wood handles and turning industry, and miscellaneous wood industries, *n.e.s.*

The sawmills and planing mills, the shingle mills, the veneer and plywood mills and the particle board plants (the latter are included in the miscellaneous wood industries, *n.e.s.* group) mainly use roundwood as a raw material and sometimes are called primary wood industries and are dealt with separately below. The other industries, which constitute the secondary wood industries, further manufacture part of the production of the primary wood industries into a great variety of products. However, most of the production of the primary wood industries is not further processed.

Sawmill and Planing Mill Industry.—Lumber is by far the most important single product of this industry and, as shown in Table 10, British Columbia is the most important province in this field. It should also be noted that the shipment figures of Tables 10 and 11 contain a certain element of duplication because sales of lumber from one sawmill to another will be reported as shipments by both establishments. Similar situations occur in most industries to a greater or lesser extent.

In addition to the lumber produced by the sawmill and planing mill industry, a small amount is produced by establishments classified to other industries, bringing total lumber production in Canada in 1968 to 11,351,000 M ft. b.m. compared with 10,329,425 M ft. b.m. in 1967.

10.—Lumber Production and Shipments and Value of All Shipments of the Sawmill and Planing Mill Industry, by Province, 1967 and 1968

Totals.....	10,217,934	767,773	10,335,148	803,262	10,987,031	1,002,407

Shingle Mill Industry.—Most of the shingles and shakes produced in Canada are from British Columbia mills. All establishments classified to this industry reported, for the year 1968, shipments of 2,492,309 squares of shingles and shakes valued at \$43,225,720, of which British Columbia accounted for 2,393,736 squares valued at \$42,231,745. However, it should be mentioned that considerable quantities are produced by establishments classified to other industries and by individuals intermittently operating one or two shingle machines or producing by hand; although no adequate measure of this production is available, it is known to contribute significantly to the total. Of the total production in 1968, 2,666,178 squares were exported, 2,619,323 squares going to the United States.

Veneer and Plywood Industry.—The production of hardwood veneer and plywood in Canada is confined largely to the eastern provinces and the production of softwood veneer and plywood almost entirely to British Columbia. For the latter, Douglas-fir is most commonly utilized because of the availability of large-diameter logs of this species from which large sheets of clear veneer can be obtained. Of the hardwoods, Yellow Birch is by far the most important species. Although most of the raw materials for this industry are of Canadian origin, some decorative woods are imported, particularly walnut.

About 46 p.c. of the shipments of veneer, shown in Table 12, are softwood veneers; most of these are further manufactured into plywood by Canadian mills, thus contributing to the shipments of plywood shown in the same table. Some of the hardwood veneers are also shipped to other veneer and plywood mills for further manufacture or to other industries such as the furniture industry for veneering purposes, but a significant portion is exported. Total exports in 1968 amounted to 1,051,269 M sq. ft. valued at \$33,142,000, of which 983,578 M sq.ft. valued at \$28,780,000 went to the United States.

Most of the plywood is consumed in Canada, although exports are not unimportant; in 1968 these amounted to 36,609 M sq. ft. of hardwood plywood valued at \$6,818,000 and 690,263 M sq. ft. of softwood plywood valued at \$46,122,000. The greater part of the exports of hardwood plywood went to the United States (33,466 M sq. ft. valued at \$6,085,000) but most of the softwood plywood exports went to Britain (489,301 M sq. ft. valued at \$32,401,000).

Subsection 3.—Paper and Allied Industries

The standard industrial classification subdivides the paper and allied industries group into the following industries: the pulp and paper industry, the asphalt roofing manufacturers, the paper box and bag manufacturers, and other paper converters. Statistics of manufacturing activity and total activity of the paper and allied industries group are given in Chapter XVI on Manufactures.

Pulp and Paper Industry.—This industry is by far the most important of the group. In fact, it has been for many years the leading industry in Canada, contributing about 2 p.c. of the total gross national product and over 13 p.c. (1968) of the total value of the country's exports. There were 137 pulp and paper mills in operation in 1968.

These mills consume enormous quantities of roundwood, 18,371,821 rough cords with a cost value of \$523,343,000 being so used in 1968. In that year, 115,000 cords of pulpwood were imported and 1,059,000 cords were exported. In addition, the pulp and paper mills use wood residues of the sawmill and other industries for pulping, such as cores of peeler logs, slabs and edgings or wood chips made thereof, shavings, etc., and recently even sawdust has been used successfully for this purpose. The total of such wood residues used by the industry in 1968 amounted to the equivalent of 6,907,744 rough cords of pulpwood, valued at \$143,322,000. The industry also consumes large amounts of electric power, chemicals and other goods and services and requires great quantities of clean water.

Pulp and paperboard mill at Jonquière, Que. Canadian mills account for more than a third of the world trade in pulp, paper and paperboard which totalled 40,000,000 tons in 1970. The benefits of this export trade are felt in every part of the country.

Some of the production of the pulp and paper industry is consumed in Canada or serves as a raw material for the paper-using or secondary paper and allied industries and certain other industries, but a great part of it is exported, particularly newsprint and various types of pulp (see Table 15), most of it to the United States. Some plants included in the pulp and paper industry classification also convert basic paper and paperboard into more highly manufactured papers, paper goods and boards but their output represents only a small part of Canada's total production of converted papers and boards. Tables 13 and 14 give shipment and production figures for pulp and shipment figures for basic paper and paperboards for 1964-68 and Table 15 shows exports of pulp and of newsprint to Britain, United States and all countries for 1965-69.

¹ Figures differ slightly from DBS figures given in Tables 14 and 15 because of different bases of calculation.

Asphalt Roofing Manufacturers.—These establishments produce composition roofing and sheathing, consisting of paper felt saturated with asphalt or tar and, in some cases, coated with a mineral surfacing. They also produce asphalt, vinyl-asbestos and pure vinyl floor tiles. Their total shipments in 1968 were valued at \$58,567,000 compared with \$59,533,000 in 1967.

Paper Box and Bag Industries.—These industries include manufacturers of folding cartons and set-up boxes, manufacturers of corrugated boxes and manufacturers of paper bags. Their total shipments in 1968 amounted, respectively, to \$166,486,000, \$240,045,000 and \$170,083,000, compared with \$161,546,000, \$229,438,000 and \$157,006,000, respectively, in 1967.

Other Paper Converters.—This group produces a host of paper products such as envelopes, waxed paper, clay-coated and enamelled paper and board, aluminum foil laminated with paper or board, paper cups and food trays, facial tissues, sanitary napkins, paper towelling and napkins, toilet tissue, etc. The total value of manufacturing shipments of this industry in 1968 amounted to \$339,960,000 compared with \$322,608,000 in 1967.

Section 4.—Forest Administration, Research and Conservation

Subsection 1.—Federal Forestry Program

Administration.—The Federal Government is responsible through several departments and agencies for the protection and administration of the forest resources in the Yukon and Northwest Territories and on other federal lands such as the national parks, Indian reserves, military areas and forest experiment stations.

The primary federal organization concerned with forestry is the Canadian Forestry Service of the Department of Fisheries and Forestry. The Canadian Forestry Service was formerly the Forestry Branch of the same department, the change in name becoming effective in 1969. The main functions of the Service under the Forestry Development and Research Act include: (1) conducting research relating to the protection, management and utilization of the forest resources of Canada and the better utilization of forest products; (2) undertaking, promoting and recommending measures for the encouragement of public co-operation in the protection and wise use of the forest resources of Canada; (3) entering into agreements with provincial governments and individuals relative to forest management, protection or utilization, for the conduct of research relating thereto, or for forest publicity or education; (4) providing forest surveys and advice on protection and management of federally administered forest lands; and (5) assuming responsibility for forest protection and management on federal lands at the request of the department or agency concerned.

Heading the Canadian Forestry Service is an Assistant Deputy Minister responsible to the Deputy Minister of the Department. Reporting to the Assistant Deputy Minister are the Directors of Coordination, Operations, and Forestry Relations. The three Directors are responsible respectively for program development, co-ordination and control; the control and co-ordination of management resources (including personnel, finances and facilities); and forestry matters involving other federal and provincial government departments as well as national and international agencies and organizations. Within the Service there are seven research institutes undertaking work which, for the most part, has broad national applications. This research supports and complements the activities of six regional forest research laboratories serving Newfoundland, the Maritimes, Quebec, Ontario, the Prairies and British Columbia. In 1969, the former Alberta-Northwest Territories-Yukon Region and the Manitoba-Saskatchewan Region were combined to form the new Prairies Region with headquarters in Edmonton, Alta. Forest products research is conducted at two forest products laboratories—one located at Vancouver, B.C., and the other at Ottawa, Ont.

The forestry program of the Canadian Forestry Service falls within three categories—forest resource research and services, forest products research and services, and support of university research.

Forest Resource Research and Services.—The work undertaken in this category covers research, surveys and related services pertaining to forest land and forest soils; forest inventory and mensuration; silviculture and tree biology; timber harvesting; protection against fire, insects and diseases; and forest economics.

Research in forest land is directed largely toward establishing practical land classification systems for forestry purposes. This work is an integral part of the Canada Land Inventory and the Bio-physical Land Classification System. In forest-soils research, programs dealt with include soil chemistry, soil biology and the hydrologic characteristics of watersheds but, currently, considerable emphasis is being given to forest fertilization and related mineral-nutrition studies.

Considerable attention is devoted to improvement of forest inventory techniques; large-scale aerial photography, combined with a radar altimeter, has been developed to the point where it is in operational use in a forest inventory of Labrador. Research in new techniques of remote sensing for forestry purposes is accelerating, and the possibility of

ultra-small-scale, high-altitude aerial photography and satellite photography is being investigated. Studies of growth and yield, the evaluation of site potential, and the development of mathematical models for trees and forests are continuing.

A substantial portion of the research program in silviculture involves the study of factors responsible for the success or failure of natural regeneration following various methods of cutting and treatment of seedbeds; the development of improved methods of regenerating forest stands following logging or fire; and the establishment of forests on abandoned farmland, heathland or bogland. Different methods of seeding and planting are being compared, and increased emphasis is being given to problems associated with container planting. The effects of mechanization of logging on reproduction and on slash and soil conditions are being investigated. Studies of different methods of stand-tending such as pruning, cleaning and thinning are under way to determine means of increasing both quantity and quality of wood production. Investigations of successional changes are in progress in most of the important forest types, and the relation of forest growth to site is being studied with a view to the assessment of long-term productivity. The light, temperature and moisture conditions required to produce optimum growth and development of various tree seedlings are being determined to provide guidelines for improved forestry practices. In tree breeding, superior strains are selected or developed, and there is continual improvement in propagation and breeding techniques.

Research on timber harvesting has been intensified by work conducted within the newly established logging development program of the Forest Management Institute. The objective of this work is to improve logging productivity and reduce the cost of wood delivered from the standing forest to the consuming mills.

Adequate protection of forests against fire is of vital importance in Canada. The Service works in full co-operation with provincial forest services in almost all phases of forest fire control and has made major contributions in the fields of forest fire danger measurement and forecasting and in fire control planning. Investigations are being made of forest fire behaviour, of the use of prescribed fire for hazard reduction and seedbed preparation, of better methods of reporting forest fires, and of fire damage appraisal and related factors in forest protection standards. Studies are being continued in the use of chemicals for fire suppression and pre-suppression, of fire fighting equipment and techniques, and of the use of aircraft in forest fire control. Another important field of endeavour is the study of fire hazard created by slash from various kinds of logging practices for different species.

Research on forest insects and diseases is conducted at Service regional laboratories and field stations throughout Canada. A Canada-wide survey is undertaken in co-operation with the provincial forest services and forest industries to maintain an annual census of forest insect and disease conditions and to detect and predict the occurrence of outbreaks. Survey results are made available to owners and operators of forest lands for use in planning salvage programs and directing control measures to reduce damage.

Laboratory research programs are designed to lead to comprehensive understanding of the biology and ecology of the more destructive forest insects and fungi, and the causes of fluctuations in abundance or severity of damage in time and place. Problems under intensive study include insect defoliators, leaf diseases, sucking insects, dwarf mistletoes, stem cankers, bark- and wood-boring beetles, trunk and root decays, tip- and root-boring insects, and diseases of tree seedlings in forest nurseries. Research on development, physiology, nutrition and taxonomy complements the field ecological studies of insects and fungi. Problems of national importance in insect pathology, cytology and genetics, bio-climatology and chemical control are investigated.

Experiments are also carried out in insect and disease control, utilizing cultural techniques, chemicals and biological control agents including parasites, predators and insect pathogens. Technical advisory services are provided in evaluating quarantine programs, possibilities of eradication or control, or other applications of research results. Examples include recommendations for reduction of seedling losses in forest tree nurseries through

A technician mounting specimens for the insectary collection at the Forestry Research Laboratory, Victoria, B. C.

cultural techniques and chemical applications; the co-operative organization of cull surveys to improve forest inventories; consultation and advisory services for local authorities on the Dutch elm disease problem; and technical co-operation with provincial governments and industrial agencies in the organization of spraying operations against the spruce budworm in New Brunswick, the ambrosia beetle in British Columbia, and the red-headed pine sawfly in Ontario and Quebec.

Current research in the economics of forest resources includes compilation and assessment (on a national basis) of provincial forest inventories, an investigation concerning the size and seasonal distribution of a mobile airtanker fleet, studies of supply and demand prospects for Canada's timber, assistance in multiple use land planning, work on the use of linear programming as a macro management tool, and an assessment of the birch resource in Canada. In the field of communication and service, other studies are proceeding on economic indicators in forestry and forest-based industries, on short-term lumber price predictions, and on lumber consumption forecasts.

Forest Products Research and Services.—This work is directed toward obtaining background data on the properties of Canadian woods, developing new and better uses for wood products, improving methods of processing, and effecting more complete utilization of wood substances. Activities cover all major aspects of forest products and include the determination of the physical, mechanical, chemical and anatomical properties of wood and their relation to adaptability in use; studies of factors affecting quality of wood and of manufactured wood products; determination of factors that cause wood waste in logging and manufacturing; investigation into fire retardant treatments, the preservative treatment and painting of wood and the use of wood for the manufacture of a variety of products by chemical or mechanical means; and studies to determine possible new economic and more valuable uses for woods and to determine methods for the economical utilization of all wood substances available from the annual timber harvest.

The program is conducted mainly at two laboratories—Ottawa and Vancouver—with research units covering timber engineering, containers, glues and gluing, veneer and ply-

wood, timber physics, wood chemistry, pulping, wood preservation, paints and coatings, wood pathology, products entomology, wood anatomy, logging, lumber manufacture and lumber seasoning. Research results are made available to the thousands of plants comprising Canada's timber-manufacturing and wood-using industries. Liaison is maintained with these industries to ensure that the research being conducted is of optimum national benefit. There is also constant co-operation with various government units in conducting many investigations concerned with wood use. Research into the use of wood in housing construction and as an engineered material continues in co-operation with the National Research Council and the Central Mortgage and Housing Corporation.

A number of regional establishments have forest products liaison officers who visit sawmills and other wood-working plants to keep industry aware of research developments and technical advances and to ensure that the Service is informed of field problems on which research would be of value.

Continuing research on the economics of forest products covers a survey of lumber and wood-based panel products utilized in residential dwellings, together with a study of possible future markets for lumber and plywood.

Service personnel serve on many national and international technical committees concerned with forestry problems, and continuous collaboration is maintained with forest products laboratories in other countries for the dual purpose of exchanging information and avoiding duplication of research.

Support of University Research.—Operating grants are made available to the four Canadian forestry schools to assist their development through support of research conducted by faculty members and post-graduate students.

Testing the durability of a packing box constructed of particle board in the Forest Products Laboratory at Ottawa, where new uses for wood in many forms are under constant study.

Subsection 2.—Provincial Forestry Programs

All forest land in provincial territory, with the exception of the minor portions in national parks, federal forest experiment stations, military areas and Indian reserves, is administered by the respective provincial governments. The forestry program of each province is outlined below.

Newfoundland and Labrador.—Geographically, the Province of Newfoundland has two separate regions—the Island and Labrador on the mainland. The productive forest land is estimated at approximately 30,000 sq. miles about equally divided between the Island and Labrador. Most of Labrador's forests are leased but are as yet virtually untouched.

A large part of the forest land of the Island is leased, licensed or owned by paper companies, but a three-mile-wide belt along most of the coastline is retained as unoccupied Crown land for the purpose of providing firewood, construction material, fencing material, etc., for the local populations. Within this coastal forest belt, every form of cutting is generally without intense control or restriction but a policy is being introduced whereby cutting in certain 'management areas' is controlled by Forest Service Officers. Approximately one half of the Crown forests are at present under management. Commercial timber-cutting on unoccupied Crown lands has been by permit since 1952; permits for amounts up to 120 cords per person are issued by the field staff but permits for larger quantities must be approved by the government.

The Island is divided into three forest regions, each of which is subdivided into five districts. Each region is under the control of a regional forester and each district is headed by a district ranger with a staff of rangers and assistant rangers. Twenty-four well-equipped forest fire depots and nine lookout towers, connected by radiotelephone to district and regional offices, are operated by the Newfoundland and Labrador Forest Service; others are operated by the two paper companies which maintain their own forest fire protection organizations.

Forestry operations in Labrador are under the supervision of a regional ranger located at Happy Valley (Goose Airport). Forest fire protection bases are located near Goose Airport and at Labrador City, Churchill Falls, Cartwright and Makkovik.

The Forest Service operates 10 fixed-wing aircraft for forest fire detection and suppression and three helicopters for transporting men and equipment. The permanent Forest Service staff of approximately 130 persons is enlarged during the fire season with the addition of about 70 seasonal employees.

Prince Edward Island.—Roughly one third of Prince Edward Island's 2,184 sq. miles of land is tree-covered. The wooded areas consist of scattered patches throughout the province, the greatest concentration being in the eastern section. All of the woodland is privately owned except some nine square miles of federal Crown land.

The Forestry Branch of the Department of Agriculture administers all forestry matters in the province—reforestation, protection and woodlot improvement. The reforestation program has been increasing year by year, as many as 500,000 trees being planted in one year on provincially owned and privately owned land. The Forest Nursery is being expanded and by 1975 will be providing some 6,000,000 trees annually.

The forest management programs include the provision of access roads into Crown land areas and woodlot improvement; improvement cuts act as demonstration areas for the public and for 4-H Forestry Clubs and Boy Scout and Girl Guide groups. Fire protection is not too serious a problem in this province as wooded areas are relatively small and scattered and are all accessible by road so that equipment can be rushed to the scene of a fire quickly and easily.

Nova Scotia.—Of Nova Scotia's land area of 20,402 sq. miles, 16,274 sq. miles are classed as forested and 93 p.c. of the latter is regarded as productive. Although 91 p.c. of the forest land in Canada is held by the Crown in the right of the federal and provincial governments, only 22 p.c. is so held in Nova Scotia. To promote education and dialogue among various forest users, representative county Forest Practices Improvement Boards are being set up.

The provincial Crown lands are administered by the Department of Lands and Forests through a staff of foresters and rangers. Trained provincial personnel are also employed with some of the forest industries in the administration of privately owned forest lands. The Department administers the Lands and Forests Act as it pertains to all lands, and is responsible for forest fire suppression. Forest fire detection is facilitated through 35 observation towers and an aerial patrol service. In 1969, 623 forest fires burned 2,812 acres. Three fires exceeded 50 acres, and 36 p.c. were under $\frac{1}{4}$ acre. Fire suppression crews and rangers with equipment are stationed throughout the province.

The forest industry is of prime importance to the economy of Nova Scotia, contributing directly or indirectly over \$100,000,000 to the gross provincial product annually. There are in operation some 350 sawmills of various types and sizes, one hardboard mill, two ground-wood pulp mills, and two chemical pulp mills. These mills processed 230,000 M ft. b.m. of sawn materials and 910,000 cords of round products in 1969, including 120,000 cords-equivalent of pulp chips from sawmill residues. In addition, 90,000 cords of pulpwood were exported.

The reforestation program, active since the 1930s, is being expanded. Experimental work on bullet planting, direct seeding, soil capability and site preparation continues. Seedbeds have been laid for a threefold increase to 3,000,000 seedlings by 1973.

Timber, pulpwood and Christmas trees are sold through public tender, and cutting on Crown lands is done under recommendation of district foresters of the Department of Lands and Forests. Management cruises, regeneration studies and experimental cuttings are conducted on Crown lands, and a program of operating these lands under sustained-yield management plans is under way. Silvicultural techniques, including thinning, conversion cutting, aerial and ground fertilization, bog-ploughing and the use of silvicides, were applied to 2,500 acres of Crown lands in 1969.

A new provincial forest inventory, which is a continuous system designed to operate on a seven-year cycle, was in its third year in 1969. Concurrently, a system of 1,750 permanent sample plots, due for completion in 1970, will provide continuing data on growth and drain. Aerial colour photographing of Cape Breton Island was done in 1969.

Forest research is carried on by Federal Government agencies and the Nova Scotia Research Foundation. Investigations cover stand improvement, tree nutrition, cutting methods, and insect and disease activities. Extension projects include fire prevention, a film program for schools, distribution of information on forest and wildlife conservation, promotion of the Christmas tree industry, woodlot improvement, preparation of material for the mass media, and technical assistance to sawmill operators.

New Brunswick.—Of the total land area of New Brunswick (27,835 sq. miles), approximately 86 p.c. is classed as productive forest, of which the Crown, in right of the province, owns about one half. About 2 p.c. is owned by the Federal Government and the remainder is privately owned. The results of a provincial forest inventory, part of the national forest inventory, were published in 1958. The total volume of standing timber in the province is estimated at 16,871,000 M cu. ft.; coniferous species make up 71 p.c. and deciduous species the remainder.

Protection from forest fires, the first requirement for forest conservation, is mainly the responsibility of the Department of Natural Resources which also carries out duties in connection with game management and protection, provincial parks, mines, water, tourism and the administration of provincial Crown lands. A large-scale aerial spraying

program to protect balsam fir and spruce from the spruce budworm has been carried on since 1952 by a Crown company sponsored by the federal and provincial governments and by representatives of the forest products industries. Forest Management Licences authorize operators to cut and remove forest products in accordance with forest management plans and cutting permits. Royalty is paid to the province when products are cut by the licensees.

New Brunswick does not maintain a forest research organization but co-operates with the Canadian Forestry Service in that field. The University of New Brunswick has also undertaken a small number of forest research projects in co-operation with the National Research Council, the provincial government and other interested organizations.

In the field of education, the University of New Brunswick offers undergraduate and graduate courses in forestry leading to B.Sc.F. and M.Sc.F. degrees. It is also responsible for the administration of the Maritime Forest Ranger School in conjunction with the Governments of New Brunswick and Nova Scotia and with private industry. The forest extension services of the University assist both government and private agencies in the direction and planning of various forestry extension programs. The provincial Department of Agriculture also provides an expanding extension service to the owners of farm woodlots.

Quebec.—Well over half of Quebec's area of 594,860 sq. miles is under forest, stretching from the southern border northward to an irregular line roughly following the 54th parallel, and from the Ontario border in the west to the Atlantic coast in the east. Of the total forested area, about 93 p.c. is publicly owned and the remainder privately owned. About 64 p.c. of the publicly owned forest is "open forest", 26 p.c. is under timber lease and 10 p.c. is set aside for particular use. All forests serve to feed the province's large pulp and paper mills and numerous sawmills but, at present, about 25 p.c. of the annual cut comes from privately owned land. A preliminary inventory has recently been completed of the publicly owned forests and operations there are now under way in the accessible regions of northern Quebec; these forests are subject to a general management plan of cutting and conservation under which they will be able to supply the ever-increasing demand for forest products.

The management of the publicly owned forests, their development, control and supervision, is the function of the Woodlands and Forestry Branch of the Department of Lands and Forests, which also, in certain circumstances and when it is in the public interest to do so, manages privately owned forests. The Branch administers a number of tree nursery operations which provide some 100,000,000 seedlings annually for reforesting areas throughout the province where natural regeneration is inadequate. The Conservation Branch, either directly or through various organizations, looks after fire protection and insect and disease control.

Since Quebec's forests provide some 25 p.c. of the gross value of production in the province, their importance is such that their management merits intensive consideration and study. Thus, the Department of Lands and Forests considers that periodic review of its program is essential to keep abreast of progress in the various sectors of the forest industry, to bring about a maximum output from its forest capital, and to enable the industry to meet the constantly changing and increasing demands of the world market.

Ontario.—The boundaries of Ontario enclose an area of 412,582 sq. miles—83 p.c. land and 17 p.c. water. Forest lands comprise 75 p.c. of all the land, of which 164,600 sq. miles are classified as productive. The Crown owns 90 p.c. of the productive forest land. Although 84 tree species (exclusive of the hawthorns) occur within Ontario, four species (Black Spruce 29 p.c., poplars 19 p.c., Jack Pine 13 p.c., and White Birch 11 p.c.) account for almost three quarters of the total volume of standing trees. The total volume of merchantable standing timber is estimated at 111,000,000 M cu. ft.—60 p.c. softwoods and 40 p.c. hardwoods.

Crown forests are administered and managed through the Department of Lands and Forests, which has 10 Branches at Head Office and 21 forest districts (grouped within

three regions). The Branches may be classified as service (Accounts, Law, Operations, Personnel, and Research) and operating (Fish and Wildlife, Forest Protection, Lands and Surveys, Parks and Timber). The list of operating Branches indicates that a multi-use concept of forests is practised but only the programs that foster the growth and use of timber as a crop are discussed here.

Management.—The original function of the Timber Branch was to arrange for the orderly sale of timber and this important function is still carried out along traditional lines—operators are granted a licence to cut specified timber for which they pay stumpage at contractual rates on the measurement (scale) of products removed. However, the details and techniques of utilization are undergoing constant improvement. Although Ontario's forest-based industries have long been a Canadian leader in terms of diversity of products and value of shipments, there is still a surplus of timber over actual cutting in the province. To ensure the continuing supply of timber of the type required by industry, an effective management policy has been conceived. Continuing forest inventories, using aerial photographic methods in which the province pioneered, provide an up-to-date record of the forest wealth, showing the species and other characteristics of stands and their geographical distribution. Inventory data are then applied to management planning; the province has been divided into 205 management units, each homogeneous with respect to forest and use patterns. Long-term plans set out regulations on the volume and location of cuttings and include programs for regeneration and tending that will sustain yields. As of 1969, 197 plans (79 Crown Units, 57 Company Units and 61 Agreement Forests) were either completed or in process of completion for approximately 197,000 sq. miles.

The Timber Branch is also responsible for the regeneration, tending and improvement of the forests on Crown lands. It operates 10 forest tree nurseries (with supporting tree seed collection, treatment and storage plant) currently geared for an annual output of about 100,000,000 units.

While the Department, directly or indirectly, supervises all planting projects on Crown lands, regeneration agreements have been signed with all major licensees whereby they assume the direct responsibility for the conduct of planting projects, receiving payment at an agreed rate for work completed. Similarly, other projects, such as site preparation for the planting, may be performed by the companies under the same agreement.

During 1969, 47,650,000 nursery-produced trees were planted on about 66,100 acres of Crown lands. The tubed seedling program continued in 1969 and a total of 12,350,000 tubed seedlings were planted on about 13,000 acres. Other silvicultural treatments included the direct seeding of 11,150 acres, treatment for natural regeneration on 43,300 acres and stand improvement (cleaning, spraying, thinning, pruning, etc.) on 63,000 acres. In all, 196,600 acres of Crown land were silviculturally treated in 1969 to promote regeneration or to improve the forests.

For half a century, Ontario has had enabling legislation that permits municipalities and conservation authorities to place abandoned and submarginal agricultural lands, to which they have acquired title, under agreement with the Department of Lands and Forests, which undertakes to plant and manage the properties for a specified period of time—usually 50 years. Nearly 230,000 acres currently under such agreements have been managed intensively, the plantations receiving regular thinnings. The trees removed are in demand for pulpwood, posts, poles and sawlogs, making the undertakings financially attractive. In addition, the properties that are close to centres of population are acquiring tremendous value as recreational areas.

Owners of private land may purchase planting stock for forestry purposes from government nurseries at nominal prices and may also receive free professional advice on any forestry matter, including silviculture, harvesting and marketing. Under the Woodlands Improvement Act, 1966, it is possible to have planting and improvement work carried out completely under government direction and mainly at its expense. In

return, the owner is required to meet a few modest demands that ensure his good faith. This program has, in three years, planted nearly 10,000 acres of idle land, and updated forest management on 16,000 acres of privately owned land.

In Ontario, the utilization of timber crops, the processing of forest products and the distribution of commodities of wood to markets are functions of private enterprise. Primary mills licensed in 1969 and supplied principally from provincial forests include 24 pulp and paper mills, 30 veneer and plywood mills and 815 sawmills of all types. Although the consumption trend for wood is upward, the costs of wood at the mills have also been increasing and this has led to increased mechanization and, in turn, to entirely new technologies of logging and product transfers. These changes have put pressure on the traditional methods of wood measurement, and the Department has adopted or is further testing alternative practices including (1) tree-length scaling, (2) weight scaling, (3) sample scaling, (4) measurement of log diameters to the full inch, and (5) log grading. In addition, the data and the invoicing of licensees are being computerized.

Certain parts of the Crown forests remain under-developed. For such areas, the Economics Unit has undertaken feasibility studies and has had a principal role in getting new firms to establish. Other functions of the Unit include co-operation in expanding the available statistical information for the forestry sector, development of economic guides for timber management, analysis of current manufacturing costs and market prices, evaluation of the impact of policy decision and economic service to other Branches.

Protection.—The area under organized forest protection in Ontario totals 180,275 sq. miles and includes the main central band of accessible forests. This area is organized into 20 fire districts and further subdivided into 54 chief ranger divisions for the purpose of forest protection. South of this area, in the highly developed agricultural counties of southern Ontario, the municipalities are responsible for fire control. The vast inaccessible areas to the north of the fire districts, totalling over 134,000 sq. miles, do not support significant stands of merchantable timber and, except for communities or other special values, are not protected. Within the fire districts, agreements were in effect in 1969 with 216 municipalities for the prevention and control of forest fires. An agreement was also in effect with the Federal Government for the protection by the Ontario Department of Lands and Forests of 958,000 acres of Indian lands in the province. The average annual number of fires for the 1960-69 period was 1,422 and the average annual burn was 142,759 acres.

Forest fire detection is accomplished through a combined aerial patrol and lookout tower system as well as through reports from the public. Based on the results of continuing study and analysis programs, selected towers in some areas are being phased out in favour of aircraft. Work with long-term fire retardant chemicals indicates that they can be useful in fire control operations in Ontario; operational adoption, phased over the next two to three years, is planned. Prescribed burning as a silvicultural and hazard reduction tool was continued in 1969 with 19 burns covering 5,933 acres.

The integral float tank water-bombing system installed on Department aircraft was employed in the control of fires. The aircraft fleet as of Jan. 1, 1970, comprised 26 Turbo Beavers, 10 Otters, three Twin Otters and one Beechcraft Duke; five Bell G-4 helicopters were leased during the fire season. The communications system included 186 ground stations, 277 lookout tower radios, 20 patrol vessel radiotelephones, 674 mobile radiotelephones, 1,344 portable fireline radios, 41 aircraft radio installations and 74 portable aircraft radiotelephones.

Forest pest control in 1969 was again highlighted by the spruce budworm spraying in northwestern Ontario, where 25,000 acres were treated. Small acreages on Crown-owned and Crown-managed areas were also treated in 1969 for White Pine weevil, European Pine sawfly, Jack Pine budworm, White Pine blister rust and fomes root rot.

Manitoba.—The administration of Manitoba forests is controlled by the Resources Planning Branch of the Department of Mines and Natural Resources. The province is divided into four regions, each under a Regional Director who is responsible for the field

administration of forests in his region. The Regional Director works under policy guidelines established by the Resources Planning Branch, relating to timber disposal, reforestation and fire protection.

The Resources Planning Branch co-ordinates control measures for the propagation, improvement and management of the forests, the harvest of forest products, and forest inventory surveys. A nursery station is maintained to supply stock for reforestation of denuded Crown land and some natural seed areas have been established for nursery stock. Seedlings are supplied to farmers for shelterbelts and woodlots and to commercial Christmas tree producers and an average of more than 4,000,000 are planted each year in reforestation projects on Crown lands. The program of forest stand improvement comprises thinning, clearing and chemical spraying to remove undesirable species and encourage growth of preferred trees. Forest inventories cover about 5,500 sq. miles annually and, on the basis of these inventories, working plans with annual allowable cuts on a management unit basis are in operation.

Timber-cutting rights are awarded by Forest Management Licences, Timber Sales and, in certain cases (particularly for salvage operations), by Timber Permits. Forest Management Licences may be granted for periods of up to 20 years and are renewable; Timber Sales may be for varying periods from one year upward and Timber Permits for periods of up to one year. At present, one long-term Pulpwood Berth with an area of 2,745 sq. miles and 10 long-term Timber Berths, all granted prior to 1930, are in force. A second Pulpwood Berth agreement was signed in 1966, covering the construction of a pulp mill and sawmill at The Pas in northern Manitoba.

The area of the province under forest fire protection is 128,370 sq. miles with zones of priority established in the less accessible areas. Fires are detected through a comprehensive network of lookout towers and supporting air and ground patrols, all in communication by radio and Departmental or public telephones. Two Canso water-bombers and two helicopters are rented for the worst of the fire season to supplement the 10 aircraft of the Manitoba Government Air Service.

Manitoba co-operates with several federal services which maintain two research areas in the province, and works closely with federal authorities in investigating and controlling forest damage resulting from insects and diseases. Public education in the fields of fire prevention and forest conservation is carried out and use is made of radio, television, newspapers, pamphlets, signs, film tours and talks.

Saskatchewan.—The forests of Saskatchewan are located in the northern half of the province and cover 117,738 sq. miles, or 53 p.c. of the total land area. Provincial forests constitute approximately 92 p.c. of all forest land in the province and are managed and developed by the Forestry Branch of the Department of Natural Resources.

The Forestry Branch, consisting of four divisions—Fire Control, Forest Management, Inventory and Silviculture—is responsible for developing and evaluating forest policies and management programs. The responsibility for carrying out such policies and programs is borne by the various regional administrative authorities. For purposes of resource administration, the province, with the exception of the most northern portion, is divided into three regions, each under the supervision of a regional superintendent. The regions are subdivided into conservation officer districts which vary in size according to resource base and population to be served. In the most northerly part of the province, because of various special programs with northern residents, resource administration is the responsibility of the Northern Affairs Branch of the same Department. Close liaison is maintained between the Forestry Branch and the various regional authorities.

A major responsibility of the Forestry Branch is the development of techniques in the prevention, detection and suppression of forest fires. A network of 75 lookout towers equipped with two-way radios is maintained throughout the province and is supplemented by three aircraft on regular patrol duty during the high-hazard periods. Northern Saskatchewan's communication system, with more than 1,300 two-way radio sets in operation in

towers, vehicles, aircraft and forest camps, plays a vital role in the detection and suppression of forest fires. These activities are assisted by the use of two helicopters and seven aircraft equipped for water-dropping.

Alberta.—The 157,595 sq. miles of provincial forests in Alberta are administered by the Alberta Forest Service of the Department of Lands and Forests with Head Office at Edmonton. The Service, headed by the Director of Forestry, is composed of six Branches—Administration, Timber Management, Forest Protection, Construction and Maintenance, Land Use and Training. The forest area is divided into 11 Forests, each responsible for the forest within its boundaries and under the jurisdiction of a superintendent supported by a number of specialists in areas of timber management, fire, land use, construction, communications, clerical and a complement of casual employees. These Forests are further subdivided into Ranger Districts, each supervised by a district forest officer responsible to the superintendent. A district forest officer may have several assistant rangers and other staff under his charge.

The Administration Branch supervises all Branches in maintaining general control over revenue and expenditure, equipment inventory and personnel. The general administrative policies of the Service are formulated by this Branch.

The function of the Timber Management Branch includes implementation and supervision of the timber quota system, acceptance and approval of management and annual operating plans prepared for leased and licensed Crown lands, preparation and execution of forest management plans, and disposal of Crown timber. The Branch also carries on silvicultural programs, processes applications, takes inventories of forest resources, inspects cutting areas to ensure proper logging and utilization practices and collects dues and fees.

The Forest Protection Branch is in charge of all phases of protection including prevention, detection and suppression of wild fires. This Branch includes a number of specialists such as a meteorologist, a communications officer and a special Aircraft Dispatch Section to assist in the over-all protection program.

The Construction and Maintenance Branch constructs and maintains all road, airstrip and building facilities within the area of the Service's jurisdiction.

The Forest Land Use Branch is responsible for the planning and supervision of the proper land-use practices in the forested area, including grazing, recreation and watershed management, particularly on the east slopes of the Rocky Mountains containing the two Saskatchewan Rivers. The Forestry Training Branch provides facilities and instructions for the second year of a two-year forest technology course given by the Northern Alberta Institute of Technology. It also conducts in-service training programs for all the Branches in the Forest Service.

Basic research in all phases of the forestry program is generally carried out by the Canadian Forestry Service. A new federal research laboratory is being completed in Edmonton to increase the research service that is provided.

British Columbia.—Of the 366,255 sq. miles in British Columbia, somewhat over 200,000 sq. miles are inventoried as productive forest land.* This includes close to 100,000 sq. miles of mature timber containing over 261,312,000 M cu. ft. of conifers and about 7,322,000 M cu. ft. of broadleaf species.

For administrative purposes, the province is divided into five Forest Districts with regional headquarters at Vancouver, Prince Rupert, Prince George, Kamloops and Nelson. Further decentralization of authority is effected by subdivision into Ranger Districts, of which there are approximately 22 in each Forest District. Twelve directional, servicing or policy-forming Divisions constitute the Head Office of the Forest Service at Victoria.

Efforts continue to bring British Columbia's forest resources under sustained-yield management and the forest industries are making progress toward more complete utilization

* See footnote, p. 612.

of their raw materials. The problem is urgent despite the fact that, with a present annual scale of approximately 1,890,000 M cu. ft., the total inventory would appear sufficient to support current needs in perpetuity. One of the more spectacular results of sustained-yield administration has been the swinging of a greater proportion of the annual forest harvest to the interior of the province. In 1969, the over-cut coast (wet belt) forests accounted for about 52.6 p.c. of the total forest cut and the interior for 47.4 p.c. For all practical purposes, the entire interior forest is publicly owned; a large proportion of the privately owned, leased or licensed forests are on the coast.

Several systems of timber disposal are in effect. The Tree Farm Licence is a contract between the government and a company or individual whereby the latter agrees to manage, protect and harvest an area of forest land, including any privately held forest land, on a sustained-yield basis. Tree Farm Licences are subject to re-examination for renewal every 21 years. Public Sustained-Yield Units are areas within which the Forest Service manages the Crown timber on a sustained-yield basis. Within the Public Sustained-Yield Units, recognized established logging operators can apply for Timber Sale Licences or Timber Sale Harvesting Licences which entitle them to log at a given rate per year, based on a number of factors including the operator's average rate of production at the time the unit was established.

Forest fire prevention techniques and organization for effective forest fire suppression are vital aspects of planned sustained-yield management. A greatly expanded pulp industry, added to the long-established logging and sawmill industries, has increased the necessity for more adequate fire control. Extensive use is made of aircraft under various terms of contract. Air tankers and fire-spotter aircraft are employed during the fire season and helicopters and other aircraft are employed under contract for patrol duties and for the transport of fire suppression crews. The rugged topography and the many remote and sparsely populated areas of the province demand the availability of a variety of transportation methods to tie in with early discovery of and attack on forest fires.

Close liaison with the Forestry Branch of the federal Department of Fisheries and Forestry through facilities at Victoria provides detailed information on insect and fungal enemies of the forest and on fire research.

Subsection 3.—The Pulp and Paper Research Institute of Canada

The Pulp and Paper Research Institute of Canada is a centre of research and learning concerned with virtually every aspect of the production and use of pulp and paper products. It was established in 1913 as a branch of the Dominion Forest Products Laboratories and in 1927 was reorganized under the joint sponsorship of the Canadian Pulp and Paper Association, the Federal Government and McGill University. The Institute staff carries out fundamental research and some applied research in the fields of woodland operations and pulp and paper mill operations. In addition, in co-operation with McGill University, it trains postgraduate students who are working toward master's and doctorate degrees in physical chemistry, wood chemistry, or chemical and mechanical engineering, and whose theses subjects lie in fields of interest to the pulp and paper industry.

The Institute's head office and main laboratories are located in Pointe Claire on the western outskirts of Montreal in a recently enlarged building constructed by the Government of Canada. Space provided by the University is also occupied on the campus of McGill University by Institute staff and students involved in the graduate education program. The Institute's facilities include: organic and physical chemistry, physics and engineering laboratories; pilot plants for chemical pulping, pulp and chip refining and waste liquor pyrolysis; a greenhouse and other facilities for woodlands research; an extensive library; shops and special facilities for pulp and paper testing and for photographic and microscopic (both light and electron) studies of wood, pulp and paper. It has a staff of about 200.

The Institute's research activities comprise a basic program in pulp and paper research and in woodlands research, contract research, and technical services. The basic pulp and paper research program is supported by assessments from the Maintaining Membership (some 40 companies, representing more than 100 mills and about 95 p.c. of the total production of the Canadian industry). The woodlands research program is supported by assessments on all member companies of the Canadian Pulp and Paper Association east of the Rockies that use pulpwood. Both programs comprise research of interest to the industry broadly, as distinct from that which is the concern of a single company only.

The projects in the research program range from studies of the growing seedling in the forest to the converted pulp and paper product, and are directed at seven broad research goals: reduction of wood cost, reduction of fibre cost, reduction in capital and operating costs, testing and process control, products research, reduction of environmental pollution, and basic knowledge. The Institute is regarded as a centre for broad, long-range and uninterrupted studies of basic principles and for major engineering research and development projects which individual pulp and paper companies would find difficult to justify if the costs were not shared. Moreover, the Institute is a centre of highly specialized equipment and manpower which individual companies would not normally have.

In addition to its permanent staff, the Institute, in co-operation with McGill University, has some 45 graduate students working on fundamental projects in the background of pulp and paper technology, which also serve as their theses topics. The E. B. Eddy Professor of Industrial and Cellulose Chemistry at McGill, who is also a staff member of the Institute, directs graduate student work on such subjects as the behaviour of the materials of which wood is made—cellulose, lignin and hemicelluloses. The Director of the Institute's Applied Chemistry Division, also a Professor in the McGill Chemistry Department, supervises graduate student work in polymer, surface and colloid chemistry with particular reference to those aspects that pertain to the physics and chemistry of pulp and paper. An Associate Professor of Chemical Engineering at McGill, who is a consultant to the Institute, directs graduate students in a variety of chemical studies. In addition, the Director of the Institute's Applied Physics Division, who holds a teaching appointment in McGill's Department of Mechanical Engineering, supervises graduate student investigations on such subjects as supercalendering of paper and frictional processes in polymeric systems. Other staff members who hold concurrent honorary positions at McGill as Research Associates assist in this student program.

The Institute undertakes contract research projects on a cost-reimbursement basis for individual companies or groups of companies in the pulp and paper or allied fields. The larger of these co-operative contracts have been concerned with problems of particular segments of the Canadian pulp and paper industry. The Institute also provides a broad range of technical information services to the industry and, to some extent, to other industries and the public. It maintains a specialized library for this purpose which stocks bibliographies, abstracts, translations and critical reviews for the use of the scientific staff and the industry.

PART I.—FISHERIES*

Fishing is Canada's oldest primary industry but even though commercial fishing is now of limited importance to the national economy as a whole, it is still of paramount consequence to the coastal provinces and to inland areas adjacent to waters where commercial fishing is pursued.

Canada's main fishing effort is centred in the northwest Atlantic and the northwest Pacific waters, within range of home ports. The northwest Atlantic fishing grounds are the richest in the world. The offshore banks cover about 200,000 sq. miles and are exploited by the fishing fleets of more than a dozen nations. The harvest of cod and allied species alone, which includes haddock, cusk, pollock, hake, etc., is immense and other important species yielded by this vast fishing area include halibut and other flatfishes (including turbot), and herring, mackerel, salmon, swordfish and tuna. Crustacea include lobsters and crabs, and scallops comprise the bulk of molluscs landings. Oysters and clams are harvested in inshore waters.

Salmon, halibut and herring are the principal species harvested in the Pacific Coast fisheries, although a variety of other fish and shellfish are also taken. The catches of the five Pacific salmon—sockeye, chinook, coho, chum and pink—are regulated for conservation purposes, and extensive biological and engineering facilities are maintained to safeguard and develop these important stocks. Halibut, which are fished in the Gulf of Alaska and the Bering Sea, are also closely protected by regulations to maintain stocks at optimum levels. Herring are plentiful and are landed in quantity for reduction into fish meal and oil.

Adding to the total production is a fairly large inland fishery based on the country's extensive bodies of fresh water. The Great Lakes, which have an area of about 61,000 sq. miles, yield a number of species, including whitefish, lake trout, pickerel, sauger, northern pike, yellow perch, white bass, sturgeon, smelt, carp and various species of chub. The 300

* Section I and part of Subsection 1 of Section 3 were prepared by the Information and Consumer Service of the Fisheries Branch, Department of Fisheries and Forestry, Ottawa.

fishing lakes lying in an area of about 35,000 sq. miles in the Prairie Provinces yield rich harvests of whitefish, lake trout, pickerel, pike and other species and the 10,000-sq. mile Great Slave Lake as well as smaller lakes in the Northwest Territories also produce quantities of lake trout and whitefish.

Altogether, more than 150 species of fish and shellfish are harvested by Canadian fishermen.

Section 1.—Commercial Fishing and Marketing

Canada's commercial fisheries produce a bountiful variety of fish and shellfish for home and world markets. Harvesting ocean and inland waters unusually rich in aquatic life, the nation's fishing industry ranks among the world's major producers of consumer fishery products. Canada, in terms of quantity, is among the dozen or so countries that harvest more than 1,000,000 metric tons (2,204,600,000 lb.) of fish annually and, in terms of value, consistently places among the world's top three fish-exporting countries.

Output of Canada's commercial fisheries increased substantially during the 1960s. This was a period of transition for the industry, highlighted by the introduction of the stern trawler and the development of new or expanded fisheries for certain species, notably herring, and also by the introduction of new harvesting techniques and improvements in processing capability which resulted from intensified modernization programs initiated by industry in collaboration with federal and provincial government agencies. A decade ago, the fish catch fluctuated around 2,200,000,000 lb., producing gross earnings for the fishermen of about \$110,000,000. However, beginning in 1962, catches rose in both quantity and value, reaching peak levels in 1968 of 2,929,223,000 lb. valued at \$181,379,000. The marketed value of all Canadian fish production soared from \$199,300,000 in 1960 to \$388,213,000 in 1968. Marginal declines from those records occurred in 1969.

Although the output of Canada's fishing industry is on a generally upward trend, there has been a definite decline in the number of fishermen. In 1969, some 68,000 fishermen—compared with 80,000 a decade ago—manned a fleet of over 5,000 vessels of more than 10 gross tons and 36,000 smaller craft, and fish processing plants across the country employed more than 18,000 workers. Investment in fishing craft and gear exceeded \$300,000,000.

The dawning 1970s could herald new and expanded horizons for the Canadian fisheries provided that the emerging problems of resource supply and quality are successfully overcome. The steadily mounting pressures on fish stocks from domestic and international exploitation and the increasingly serious effects of pollution on coastal and inland waters are major hazards threatening the continued growth of the industry.

Commercial Landings.—In 1969 the commercial fisheries catch of 2,715,000,000 lb. had a landed value of \$181,200,000. Nova Scotia was the top money-earning fisheries province with a catch value of \$56,000,000. British Columbia was second with a value of \$47,347,000 and Newfoundland third with \$30,735,000, followed by the other coastal provinces of New Brunswick with \$16,000,000 and Quebec and Prince Edward Island with \$9,000,000 each. Total landings for the year were down by 214,000,000 lb. and the value of landings by \$4,700,000 from the records set in 1968. The total "marketed" value of the year's output was estimated at \$375,000,000, an amount \$10,600,000 lower than that of the previous season.

Atlantic Coast fishermen landed 2,426,000,000 lb. of fish and shellfish in 1969 and, although this was about 100,000,000 lb. less than in 1968, it brought in a gross revenue of \$121,000,000, a 4-p.c. gain. Each of the five East Coast provinces shared in the value gain, even though the quantity of landings increased only in Newfoundland and Prince Edward Island. Newfoundland, which leads the provinces in quantity of fish landings, boosted its production above the 1,000,000,000-lb. mark for the first time in 1969 and Prince

Edward Island's output increased by 2,000,000 lb. to 49,000,000 lb. On the other hand, Nova Scotia's landings of 671,000,000 lb. showed a sharp drop from the previous year and those of New Brunswick and Quebec were also down.

British Columbia, although slipping behind all other sea coast provinces except Prince Edward Island in catch volume, recorded landings of 175,000,000 lb. in 1969. The landed value of this catch, at \$47,500,000, accounted for more than 25 p.c. of the Canadian total. The province's total catch was down by 92,000,000 lb. from 1968 and was little more than half the quantity taken in 1967. The salmon catch of 79,000,000 lb. was down almost 100,000,000 lb. from the previous season and was British Columbia's lowest since 1960. Although prices to fishermen averaged 35 cents a pound, 10 cents higher than the year before, the total value of Pacific salmon landings at \$27,800,000 was \$17,100,000 less than in 1968. Nearly half of the salmon catch was landed by gillnetters, 32 p.c. by trawlers and 19 p.c. by seiners.

West Coast halibut landings by Canadian fishermen reached a six-year high in 1969. This catch of 33,800,000 lb., combined with record halibut prices averaging 42.6 cents a pound, gave a return of \$14,400,000 to the fishermen. The continued ban on Pacific Coast herring fishing for reduction purposes, a necessary conservation measure, resulted in a catch of only 4,000,000 lb. worth \$221,000; this may be compared with an average catch during the years 1960 to 1968 of 337,000,000 lb. Landings of most other Pacific Coast fish were about average in 1969.

Canada's freshwater fishing industry recorded a total catch in 1969 of about 121,000,000 lb., which had a landed value of \$14,000,000 and a marketed value of about \$20,000,000. This quantity was about 6,000,000 lb. greater than in 1968 and returned to the fishermen an additional \$1,100,000.

Marketing.—The total marketed value of Canadian fishery products in 1969 is estimated to have reached \$375,000,000. As in other years, exports constituted almost three quarters of the total production, accounting for a record \$279,000,000, an increase of \$21,000,000 over the previous season. Two thirds of all fisheries products shipped by Canada were sold in the United States, another 22 p.c. went to Europe and 7 p.c. to the Caribbean. Imports of fishery products into Canada in 1969 were valued at \$42,300,000, the main species imported being shrimp and tuna.

As a consequence of reduced groundfish landings on the Atlantic Coast, the production of groundfish fillets and blocks was about 2 p.c. lower in 1969 than in 1968. Weak prices during the first nine months of the year were reflected in a lower production of cod blocks and of hake, cusk and pollock fillets and blocks, but a strong rising market for flatfish products induced a 20-p.c. increase (to 63,000,000 lb.) in the production of flounder fillets and blocks.

Fish meal production continued its upward trend. Output of East Coast herring meal rose to 92,000 tons from 87,000 tons the year before and output of groundfish meal was virtually unchanged at 47,000 tons. Of the total fish meal produced, 80,000 tons were exported, about 77 p.c. of it to the United States.

In 1969 only 622,000 cases of salmon were packed, 1,100,000 fewer than in 1968. Almost all salmon species except sockeye experienced the lowest production levels in five years and this lower volume was accompanied by higher export prices for sockeye and pinks. The prices for other salmon species remained close to 1968 levels.

About 80 p.c. of the 1969 lobster catch was exported. Of exports valued at \$37,000,000, 90 p.c. went to the United States and 8 p.c. to Europe. More than half of the lobster exports were shipped in the shell, 40 p.c. as meat and 6 p.c. canned. About 95 p.c. of the scallop exports, totalling 13,000,000 lb. valued at \$14,000,000, also went to the United States. Because of reduced market prices, the returns were \$1,000,000 below those of the previous year.

Close to 260,000,000 lb. of Atlantic groundfish were put to salt in 1969, about 2 p.c. more than in the previous year; 72,500,000 lb. of salted and dried groundfish were exported, nearly two thirds of it to the United States, Jamaica and Puerto Rico.

Section 2.—Fishery Statistics

The review of commercial fishing and marketing given in the preceding Section covers the situation in 1969 and contains estimated figures for that year. At the time of the preparation of this Chapter, however, the latest statistics available in detail for both the primary production and fish products were those for 1968 contained in the following Subsections.

Subsection 1.—Primary Production

Canadian fishing waters yielded a record harvest of fish and shellfish in 1968. Landings of all species, both inland and sea (including such non-fish items as whales, seaweed, seals, bait worms, etc.), totalled more than 2,900,000,000 lb., representing a landed value of \$181,400,000.

The value of the catch on the Atlantic Coast amounted to \$115,700,000, an increase of 11.7 p.c. over the 1967 value of \$103,600,000. The lobster catch was the most valuable at \$24,500,000 followed closely by cod at \$24,300,000. Scallops moved to third place at \$13,400,000, reflecting a substantial increase in the price of that species. Two highlights of the Atlantic Coast fishery in 1968 involved the sensational growth of the queen crab fishery which paralleled a spectacular increase in the off-shore herring fishery.

The value of the Newfoundland catch was down slightly from the 1967 high of \$29,000,000 to \$28,800,000. Herring and lobster were the only species to show increased landings. Cod landings valued at \$13,600,000 represented 47.3 p.c. of the total.

Nova Scotia catch reached a new high in 1968 at \$54,600,000. Scallops, valued at \$11,800,000 were, for the first time, the most important species from the standpoint of income to the fishermen. Lobsters at \$10,900,000 were second, followed by cod, haddock, swordfish, herring, flounders, and sole.

New Brunswick fishermen enjoyed a record catch valued at \$15,600,000, 43 p.c. higher than the 1967 value of \$10,900,000. Herring, increasing steadily from a low of \$900,000 in 1961, made a spectacular gain from \$3,100,000 in 1967 to \$4,900,000 in 1968 to become the major source of income to the fishermen. Lobster was next at \$4,000,000 and the tuna fishery made its first substantial contribution in the province with a landed value of \$900,000.

Returns to Prince Edward Island fishermen were also at a record high. Lobster at \$5,300,000 made up 62 p.c. of the total landed value of \$8,600,000. The Irish moss fishery was second at \$1,200,000 followed by scallops, oysters, cod and redfish.

Quebec landings increased in value to \$8,600,000 from \$7,900,000 in 1967. The main species were cod \$2,100,000, redfish \$1,900,000, and lobster \$1,700,000. The inland fishery in Quebec contributed \$500,000 to the total landed value.

The landings of fish from the inland waters of Ontario, the Prairie Provinces, Yukon Territory and the Northwest Territories added to a surprising total of \$12,300,000, an increase of 9.5 p.c. over the \$11,200,000 of 1967.

British Columbia landings, at \$57,300,000 in 1968, were down slightly from the all-time high of \$60,700,000 reached in 1966. The main cause of the decrease was the disappearance of herring from British Columbia waters; the value of herring landings, which was \$5,100,000 in 1966, was only \$200,000 in 1968. Salmon landings valued at \$44,900,000 were up from the previous high of \$38,700,000 reached in 1966, and the catch of tuna at \$500,000 was also a record, being more than double the previous high of \$200,000 reached in 1967.

Subsection 2.—Fish Products

According to commodity surveys conducted by the Dominion Bureau of Statistics, the value of sea and inland fish products produced at all industrial levels, including the value to fishermen, amounted to \$388,213,000 in 1968; this was an increase of 17.7 p.c. over 1967 and the highest amount on record. Much of the increase over 1967 took place in the salmon fishery of British Columbia and the herring fishery of New Brunswick.

ports.

² Includes landings by Canadian fishermen in United States

The annual output of canned salmon fluctuates considerably with the extent of the catch, as is shown in Table 6. This product has traditionally been the most important of the industry, but the demand for Atlantic Coast frozen groundfish fillets and blocks has risen very rapidly in recent years and the value of these Atlantic products was higher than that of canned salmon every year from 1963 to 1966 and only slightly lower in 1967 and 1968.

Section 3.—Governments and the Fisheries

The Federal Government has full legislative jurisdiction over the coastal and inland fisheries of Canada, and all laws for the protection, conservation and development of these fisheries resources are enacted by the Parliament of Canada. The management of fisheries is, however, shared with provincial governments to which certain administrative responsibilities have been delegated.

The federal Department of Fisheries and Forestry exercises responsibility for the management of all fisheries, both marine and freshwater, in four East Coast provinces—Nova Scotia, New Brunswick, Newfoundland and Prince Edward Island—and in the Yukon and Northwest Territories. In four inland provinces—Ontario, Manitoba, Saskatchewan and Alberta—the management of all fisheries is conducted by the provincial governments. In Quebec, the provincial government manages both marine and freshwater fisheries, but the inspection of fish and fishery products produced for sale outside the province is carried out by the federal Department of Fisheries and Forestry, as it is in all other provinces. In British Columbia, the fisheries for marine and anadromous (i.e., fish that migrate to the sea from fresh water) species are managed by the Department of Fisheries and Forestry, but the provincial government manages its freshwater fisheries. In the national parks across the country, the fisheries are managed by the Canadian Wildlife Service, Department of Indian Affairs and Northern Development.

Licences for sport fishing in all provinces are distributed by the respective provincial government which retains all revenues so collected. Sport fishing licences in the Yukon and Northwest Territories are distributed by the federal Department of Fisheries and Forestry.

Federal-Provincial Relations.—The mutual interest of federal and provincial governments in fisheries problems is recognized in the undertaking of joint studies and programs, frequently on a regional basis. Regional committees established in recent years have brought together representatives of all governments concerned for periodic discussion. Four groups have evolved: the Federal-Provincial Atlantic Fisheries Committee consisting of representatives of the Federal Government and of the Governments of New Brunswick, Newfoundland, Nova Scotia, Prince Edward Island and Quebec; the Federal-Provincial Committee for Ontario Fisheries; the Federal-Provincial Prairie Fisheries Committee comprising representatives of the Federal Government and of the Governments of Alberta, Manitoba and Saskatchewan; and the Federal-Provincial British Columbia Fisheries Committee.

Members of the Committees are the Deputy Minister of Fisheries and Forestry of Canada and the Deputy Ministers of provincial departments responsible for fisheries. Subcommittees make recommendations for industrial development, research and marketing problems. The main committee in each case co-ordinates, where practicable, all activities in the respective fields of responsibility of its members and suggests to the respective government means of carrying out fisheries programs and projects of common concern. These include the development of methods and techniques in the catching of fish and of shore and plant facilities, and studies of the economics of fisheries to ensure that any proposed program of development is soundly based.

Subsection 1.—The Federal Government

The work of the Federal Government in the conservation, development and general regulation of the nation's coastal and freshwater fisheries is performed by three agencies under the Minister of Fisheries and Forestry:—

- (1) The Fisheries Service of the Department of Fisheries and Forestry with headquarters at Ottawa, Ont., and regional offices under Regional Directors at Vancouver, B.C., Winnipeg, Man., Quebec, Que., Halifax, N.S., and St. John's, Nfld.
- (2) The Fisheries Research Board of Canada with headquarters at Ottawa and biological, technological and oceanographic stations across Canada.
- (3) The Fisheries Prices Support Board with headquarters at Ottawa.

A brief outline of the functions of each of these agencies is given in this Subsection.

The Fisheries Service of the Department of Fisheries and Forestry.—Canada's fisheries service began with Confederation and functioned as a branch of other departments until being designated as the Department of Fisheries in 1930. Under the Government Organization Act of 1969, responsibilities of the Department of Fisheries and the Canadian Forestry Service (formerly the Forestry Branch of the Department of Forestry and Rural Development) were combined to form the Department of Fisheries and Forestry.

The Fisheries Service of the Department is responsible for all aspects of fisheries management except fundamental research, including advice on the formulation of fisheries policy and responsibility for its implementation. Programs to give effect to these objectives are conducted through eight functional branches and five administrative regions.

The Conservation and Protection Branch is responsible for the conservation of stocks of fish, shellfish and marine mammals through the establishment and enforcement of regulations. The Resource Development Branch applies scientific and technical means to expand existing fisheries resources and to maintain their physical and biological environment. Programs include water pollution abatement and control, hatchery and artificial spawning channel propagation of anadromous species, sea lamprey control in the Great Lakes, etc.

The Industrial Development Branch conducts programs of exploratory fishing, fishing vessel and gear development and technical assistance with the aim of improving the income of fishermen and the efficiency of the fishing industry. It also administers a fishing vessel insurance plan and programs providing financial assistance for fishery enterprises.

An experimental fishing technique, successfully demonstrated by Fisheries Service personnel to East Coast fishermen, involves the use of small boats working in pairs and co-ordinating their operations by radiotelephone.

The Inspection Branch is responsible for the inspection of fish processing and handling facilities and of fish products entering interprovincial and export trade; also for the inspection of imported fish products and the provision of technical advice to the fish processing and fish handling industries. The Economics Branch assembles and interprets statistical data on the fisheries, and conducts studies and investigations in the primary fisheries and the processing and distribution of fishery products. The International Fisheries Branch is concerned with international consultation and co-operation in fisheries and also with jurisdictional matters, particularly in reference to territorial waters and fishing zones.

The Regional Operations Branch is responsible for the co-ordination and presentation of regional contributions to policy formulation and for the co-ordination of regional level operations. Regional Directors responsible for the implementation of Fisheries Service programs are located in St. John's, Nfld., Halifax, N.S., Quebec, Que., Winnipeg, Man., and Vancouver, B.C.

The Marketing Branch was established in 1970 to assist industry and Crown agencies in the orderly marketing of fisheries products and to conduct marketing studies and assessments. Activities also include the co-ordination of marketing programs of the Freshwater Fish Marketing Corporation and the Canadian Saltfish Corporation with those of the Department. The Branch shares its staff with the Fisheries Prices Support Board.

International Fisheries.—Recognizing the necessity for the orderly regulation of fisheries in international waters, Canada has long been a leading participant in international conferences, conventions and treaties upholding conservation principles. The Fisheries Service of the Department of Fisheries and Forestry assumes a major responsibility for the negotiation, revision and implementation of international fisheries treaties on behalf of the Government of Canada. The Branch is represented by one of its senior officers on each of nine international commissions and one international council established under the following conventions to which Canada is a party:—

- (1) the Convention between Canada and the United States for the preservation of the halibut fishery of the northern Pacific Ocean and Bering Sea;
- (2) the Convention between Canada and the United States for the protection, preservation and extension of the sockeye and pink salmon fisheries in the Fraser River system;
- (3) the International Convention for the High Seas Fisheries of the North Pacific Ocean between Canada, Japan and the United States;
- (4) the Interim Convention on Conservation of North Pacific Fur Seals between Canada, Japan, the Soviet Union and the United States;
- (5) the International Convention for the Northwest Atlantic Fisheries;
- (6) the Convention on Great Lakes Fisheries between Canada and the United States;
- (7) the International Convention for the Regulation of Whaling;
- (8) the Convention for the Establishment of an Inter-American Tropical Tuna Commission;
- (9) the International Council for the Exploration of the Seas; and
- (10) the International Convention for the Conservation of Atlantic Tunas.

The first international agreement contracted by Canada as an independent nation was a treaty negotiated with the United States in 1923 for the protection of halibut stocks off the Pacific Ocean. An international commission established under that treaty was given broader regulatory powers in subsequent conventions, most recently in 1953 when its name was changed to the International Pacific Halibut Commission.

The International Pacific Salmon Fisheries Commission has achieved much success toward rehabilitation of depleted salmon stocks in the Fraser River of British Columbia. Discussions were held in 1965 and 1966 between representatives of Canada and the United States to consider revision of the 1956 protocol which brought pink salmon of the convention area within the scope of the Commission's activities. Negotiations also took place during the same period and through 1967 in an endeavour to reach agreement on problems arising from the intermingling of salmon bound for rivers of northern British Columbia and southeastern Alaska.

Protection of the high seas fisheries of the North Pacific Ocean is the objective of the International North Pacific Fisheries Commission established under a convention ratified in 1953 by Canada, Japan and the United States. The Commission conducts co-ordinated scientific research programs and recommends conservation measures to be undertaken by the contracting parties.

Fur seal stocks of the North Pacific and its adjacent seas are protected by the Interim Convention on Conservation of North Pacific Fur Seals which was ratified in 1957 by Canada, Japan, the Soviet Union and the United States, and amended by a protocol in 1964. This convention was preceded by an international treaty signed in 1911 which prohibited the killing of fur seals at sea—a measure which, aided by careful management programs, made possible the restoration of depleted seal herds. At the present time, under the terms of the convention, Canada and Japan each receives annually 15 p.c. of the seal skins taken on the United States-controlled Pribilof Islands, and 1,500 skins from the harvest of the Soviet-controlled Commander and Robben Islands.

The International Commission for the Northwest Atlantic Fisheries (ICNAF) conducts studies and makes recommendations for measures to conserve and develop the fish stocks off Canada's East Coast. The convention establishing the Commission was signed in 1949

and has since been ratified by 14 nations: Britain, Canada, Denmark, the Federal Republic of Germany, France, Iceland, Italy, Norway, Poland, Portugal, Romania, Spain, the Soviet Union and the United States. Major conservation regulations adopted by the Commission have been related to minimum mesh sizes for trawl nets. In 1969, additional regulations were proposed for certain heavily fished stocks, including closed seasons and over-all catch limits. These are now in effect for all member nations. In 1970, a scheme of international enforcement was proposed whereby protection officers would be empowered to enforce conservation regulations adopted by the Commission not only for their own flag vessels but also for fishing vessels of other member countries.

The Great Lakes Fishery Commission, set up under the 1955 Great Lakes Fisheries Convention, provides a channel for joint action by Canada and the United States for research into Great Lakes fish stocks and a program to control the parasitic sea lamprey responsible for depleting lake trout stocks.

As a member of the International Whaling Commission, Canada is obligated to submit statistical data on whales caught by Canadian vessels and to conduct scientific studies on whale stocks of special interest to Canada.

In 1967, Canada approved adherence to the Inter-American Tropical Tuna Commission. This Commission was established in 1950 by a convention between the Republic of Costa Rica and the United States with the aim of studying relationships between the populations of yellowfin and skipjack tunas and other kinds of fish taken by tuna vessels in the eastern Pacific. Because of increasing Canadian interest in the tuna fishery, Canada became a signatory to the convention. Panama and Mexico are also Commission members.

Canada in 1967 became identified as a member of the International Council for the Exploration of the Seas. First established in Copenhagen in 1902, when it was entrusted with co-ordination of international investigations of the seas, particularly those in the eastern North Atlantic Ocean, ICES has in recent years provided considerable scientific support to the Research and Statistics Committee of ICNAF. There are 16 other member states: Belgium, Britain, Denmark, Finland, France, Germany, Holland, Iceland, Ireland, Italy, Norway, Poland, Portugal, the Soviet Union, Spain and Sweden.

The International Commission for the Conservation of Atlantic Tunas held its first meeting in 1969 with representatives attending from Brazil, Canada, France, Ghana, Japan, Morocco, Portugal, South Africa, Spain and the United States. Madrid has been selected as the headquarters for this newly formed Commission, which will undertake studies of stocks of tuna and tuna-like fishes in the Atlantic Ocean and its adjacent seas. It will recommend to the contracting parties measures for maintaining stocks of these fishes at levels that would permit the maximum sustainable catch yields for the various species.

In 1967, Canada was one of 18 nations represented at a Fisheries Policing Conference held in London, England, to consider regulations designed for safety at sea for vessels of countries fishing the North Atlantic. The conference endorsed a Convention on the Conduct of Fishing Operations in the North Atlantic and North Sea which was referred for ratification by the respective governments.

While co-operating with other nations to conserve high seas fisheries resources through international agreement, Canada acted in 1964 to protect inshore fisheries by establishing a 12-mile exclusive fishing zone on all coasts. The Territorial Sea and Fishing Zones Act proclaimed in that year has since been enforced against all countries except those having traditional fishing rights. Negotiations have been conducted with these latter countries with regard to the application of the fishing zones and to the location of base lines from which they are measured.

As evidence of its support for international consultation and co-operation in fisheries, Canada maintains active membership in the Fisheries Department of the Food and Agriculture Organization of the United Nations and in the Codex Alimentarius Commission which is concerned with world food quality standards.

The Biological Station of the Fisheries Research Board at Nanaimo, B.C., has recently been enlarged to permit extension of the Board's efforts to solve urgent problems in the management of the fisheries and in the protection of the aquatic environment.

Fed on a diet of dogfish chunks, this blackcod weighs $4\frac{1}{2}$ lb. (half commercial size) after one year in the Station's culture tank.

The Fisheries Research Board of Canada.—The Fisheries Research Board is a research organization established by Act of Parliament (RSC 1952, c. 121) for the purpose of conducting basic and applied research on Canada's living aquatic resources, their environ-

ment and their utilization. Its antecedents go back to 1898 and it is thus the lineal descendant of one of the oldest scientific organizations in Canada and one of the oldest government-supported research organizations under the supervision of an independent scientific board in North America.

By its Act, the Board is placed under the control of the Minister of Fisheries and Forestry. The Board proper consists of a permanent chairman, who is appointed by the Governor in Council and who is a member of the Public Service of Canada, and "not more than eighteen other members" holding honorary appointments from the Minister of Fisheries for five-year terms; the Act requires that "a majority of the members of the Board, not including the chairman, shall be scientists, and the remaining members of the Board shall be representative of the Department (of Fisheries and Forestry) and the fishing industry". The scientific members are drawn principally from universities and research foundations across Canada, to include specialists in disciplines related to the Board's work. The industry members are selected from among Canada's leading businessmen with an intimate knowledge of fishing and the fishing industry, and the Fisheries Service of the Department of Fisheries and Forestry representative is usually a senior staff member in Ottawa. Board members have both advisory and executive functions. The advisory functions are delegated in the first instance to regional Advisory Committees who conduct on-the-spot regional reviews and report to the Board on the operations and scientific programs with a view to their improvement. The executive functions are delegated to an Executive Committee elected from Board members and approved by the Minister.

The operations of the Board are highly decentralized, there being only a small administrative supervisory and publications staff in Ottawa. The responsibilities of the Ottawa office include planning and program co-ordination, and administration of a grant program to encourage university research in the fields of marine and aquatic science. The Board employs approximately 800 persons, of whom about 250 are scientists.

Commercial and Recreational Fisheries.—This program area is designed to add to fundamental knowledge concerning Canada's vast living marine and freshwater resources. Included are life history, population and behaviour studies leading to a sound scientific basis for the conservation and management of the commercially important fisheries including those for lobsters, crabs, shrimps, oysters, scallops, clams, marine mammals and other well-known economically important aquatic species of animals, such as salmon, cod, herring and halibut, as well as some marine plants, such as phytoplankton and seaweeds. Also included are studies in fish and shellfish diseases, fish predators and such basic studies as fish genetics, physiology and behaviour, the latter with a view to improving fish cultural and farming methods and also to improving fish farm and hatchery stocks. Besides these basic studies, new fishing grounds and new species for exploitation are sought and experiments in improving fishing methods are undertaken.

On the Atlantic Coast this work is conducted out of research stations located in St. Andrews, N.B., and St. John's, Nfld.; work on Arctic fisheries and on sea mammals is directed from a laboratory situated in Ste. Anne de Bellevue, Que.; freshwater work is carried out from a station in Winnipeg, Man.; and work on the Pacific Coast is directed from research laboratories situated in Nanaimo, B.C. The Board operates 16 research vessels for its biological studies varying from small inshore and lake craft to specially built seagoing ships. The Board acts as Canada's research agent for three international fisheries commissions and two international sea-mammal commissions to which Canada is party.

Aquatic Environment.—This program emphasizes the study of the marine and freshwater environment in which aquatic organisms live. This is under continuing study to further knowledge in primary and secondary productivity and the occurrence of ocean and freshwater life of importance to man. Considerable importance is placed upon increased research efforts associated with pollution prediction, abatement and elimination, including the effects of freshwater and marine eutrophication. Encompassed here also are investigations into the distribution and physical and chemical characteristics of major ocean currents

and the physical and biological structures of large ocean areas including the ocean bottom where concentrations of fish and other aquatic life occur. Ocean climate and ocean weather as they affect the distribution of fish and other living organisms as well as the vertical and horizontal distribution of nutrient matter and the cycle of energy and life in the seas are regularly observed and correlated. These studies, as well as special studies of interest to the Armed Forces, the Ministry of Transport and the international fishery commissions, are carried out by groups operating from Dartmouth, N.S., and Nanaimo, B.C., with strong ship support from the Armed Forces and the Ministry of Transport, and with co-operation from the Department of Energy, Mines and Resources.

Products and Processing.—Investigations are conducted toward improving methods of preserving, processing, storing and distributing fish products, as well as of utilizing all parts of the fish. These include developments in refrigeration and the use of antibiotics as fish preservatives, improvements in canning, smoking and salting of fish as well as the development of new products for the utilization of abundant species that are not now used for food. Fundamental studies of the structure and composition of fish proteins, marine oils, hormones from aquatic organisms and other products from the sea are under way.

These investigations are carried out on the Atlantic Coast at research laboratories situated in Halifax, N.S., and at St. John's, Nfld. For inland products and processing, research is centred at Winnipeg, Man., and a research laboratory in Vancouver, B.C., undertakes investigation of Pacific Coast problems.

The Fisheries Prices Support Board.—Established under the Fisheries Prices Support Act of 1944 (RSC 1952, c. 120), the Fisheries Prices Support Board is responsible for investigating and, where appropriate, recommending government action to support prices of fishery products where declines are experienced. The basic principle of the legislation is to protect fishermen against sharp declines in prices and consequent loss of income due to causes beyond the control of the fishermen. The Board is responsible to the Minister of Fisheries and Forestry and consists of a chairman, who is a senior officer of the Fisheries Service of the Department of Fisheries and Forestry and five members chosen from the fishing industry in the various fishing regions of Canada.

The Board has authority to buy quality fishery products under prescribed conditions and to dispose of them by sale or otherwise, or to pay to producers the difference between a price prescribed by the Board and the average price the product actually commands. The Board has no power to control prices other than its purchase policy nor has it any jurisdiction over operations in the fishing industry or the fish trade. Money necessary for dealings in fishery products is available to the Board from the Consolidated Revenue Fund to a maximum amount of \$25,000,000 annually on recommendation of the federal Treasury Board and authorization of the Governor in Council.

In May 1969, the Board initiated a frozen groundfish stabilization program with the objective of forestalling distress selling in normal markets and to raise the market price of selected groundfish products to a point where basic costs were recovered. Purchases by the Board of 17,500,000 lb. of cod blocks and fillets represented 26 p.c. of the total production. Before the end of the 1969-70 fiscal year, the entire supply purchased was returned, at cost, to the industry. The market price for cod blocks, which had been approximately 21 cents a pound, rose to the 26-27-cent level at year-end.

To assist salted codfish fishermen who had experienced severe price declines as the result of over-supply and currency devaluation in some traditional markets, a deficiency payment program was introduced for the 1969 production season. The deficiency payment received by fishermen amounted to one half the difference between the price actually received for each particular size and grade and a target price which was based upon the returns to fishermen during the 1967 season.

During the 1969-70 fiscal year, a total of 5,403 individual payments were made to fishermen or groups of fishermen.

Since 1966 the Fisheries Prices Support Board has operated yellow perch price stabilization programs. Losses resulted on the 1967 and 1968 programs but the 1969 program was operated without loss to the Government of Canada. Under the 1969 program, yellow perch fillets were purchased from processors at 40 cents a pound, provided fishermen received 10 cents a pound for spring perch used in the production of fillets and a minimum of five cents for all spring perch purchased in excess of the prevailing filleting capacity. During the spring season, the price to fishermen was actually blended, with the result that fishermen received 8.6 cents a pound during the spring season and an average of 11.4 cents during the remainder of the year. Despite the record 30,000,000 lb. Lake Erie yellow perch catch, these were the highest average prices received by fishermen since 1965.

To assist in meeting the Canadian requirements for the World Food Programme and to assist in providing additional employment in those areas capable of producing canned mackerel, the Board has been purchasing, since 1966, canned mackerel for shipment to developing nations. Board purchases, under this program, averaged 17,493 cases during the 1966-68 period. During 1969 the original allocation to processors totalled 23,040 cases. World Food Programme requirements necessitated the purchase of an additional 4,000 cases. By the end of the 1969-70 fiscal year, the entire Board holdings had been shipped on orders received through the World Food Programme.

The Freshwater Fish Marketing Corporation.—This Corporation was established in 1969 (SC 1968-69, c. 21) for the purpose of marketing and trading in fish, fish products and fish byproducts in and out of Canada with the objective of ensuring more orderly marketing for the benefit of the whole fishery and achieving higher and more stable prices for the catch. (See also p. 159.)

The Canadian Saltfish Corporation.—On Feb. 25, 1970, the House of Commons passed legislation (SC 1969-70, c. 32) authorizing the establishment of a corporation, the objects of which are to improve the earnings of primary producers of cured saltfish by buying and curing fish and by regulating interprovincial and export trade in both cured fish and byproducts of fish-curing. The Corporation, whose head office is at St. John's Nfld., consists of a board of directors composed of a chairman, a president, one director for each participating province and not more than five other directors, each of whom is appointed by the Governor in Council. It is assisted by an advisory committee of 15 members at least half of whom are fishermen or representative of fishermen. The limit of the Corporation's financial obligations is placed at \$10,000,000.

Subsection 2.—The Provincial Governments*

An outline of the work undertaken by each of the provincial governments in connection with administration of commercial and game fisheries is given in the following paragraphs.

Newfoundland.—The provincial Department of Fisheries in conjunction with the Newfoundland Fisheries Development Authority, a Crown corporation established in 1953, is concerned mainly with the improvement and development of fishing and production methods. It conducts experiments and demonstrations in new designs of fishing gear as well as the modification of existing types, the construction of multi-purpose fishing craft and the exploration of potential fishing grounds with a view to increasing catching efficiency.

Loans are made to processors for the establishment and expansion of fish processing plants and for deepsea draggers. Aid to fishermen for the construction of modern vessels capable of a greater variety of fishing operations and larger production is provided by loans from the Newfoundland Fisheries Loan Board and bounty payments at the rate of \$160 a ton for newly constructed vessels under the Fishing Ships (Bounties) Act, 1955.

* Prepared by the respective provincial departments responsible for fisheries administration.

The Fishing and Coasting Vessels Rebuilding and Repairs (Bounties) Act, 1958 authorizes financial assistance in maintaining and prolonging the life of the existing fleet. An Inshore Fisheries Assistance Programme provides a maximum bounty of \$10 a foot on boats measuring from 24 to 35 feet and bounties are also paid to fishermen on certain types of synthetic fibre fishing nets and lines. The Coasting Vessels (Bounties) Act, 1959 authorizes the granting, for locally built ships, of a maximum bounty of \$250 a ton for vessels measuring from 15 to less than 100 gross tons, and \$150 a ton for vessels of between 100 and 400 gross tons.

Other services include: advisory services to fishermen on gear and equipment, industrial research, plant construction, plant engineering and economics; assistance to fishermen's unions; weather and ice reports; and search and rescue. The Fisheries Salt Act, 1957 provides for rigid control over the use of fisheries salt.

Sport Fisheries.—The inland waters of Newfoundland, although they provide excellent sport fishing, are not commercially exploited. The lakes and ponds actually remain under the authority of the Natural Resources Branch of the provincial Department of Mines, Agriculture and Resources but, under federal-provincial agreement, these waters, including rivers and streams, are under federal control in matters of conservation and guardianship.

Prince Edward Island.—The sea and inland fisheries of Prince Edward Island are administered by the Fisheries Service of the federal Department of Fisheries and Forestry. The provincial Department of Fisheries supplements federal activity in this area and is concerned principally with quantifying and, within the terms of the provincial role in fisheries management, maximizing returns, both social and economic, to those engaged in the fisheries industry. The Department provides technical assistance and, in conjunction with the federal fisheries organizations, engages in experimental and developmental work in such fields as fishing methods, resource inventories, statistical studies and management assistance.

Loans are made available to fishermen and the fishing industry through the Prince Edward Island Lending Authority, a Crown corporation established in 1969 which is empowered to grant credit in the sectors of fisheries, industry, tourism and agriculture. The provincial responsibilities in the area of freshwater fisheries are discharged by the Fish and Wildlife Division of the Department of Tourism.

Nova Scotia.—Although the Federal Government has exclusive jurisdiction over the marine and inland fisheries of Nova Scotia and attends to all phases of administration related thereto, the Nova Scotia Government operates in several fields where provincial initiative is found to be necessary and appropriate, having regard for the importance of the fishery resources in terms of employment, industry, trade and recreation.

In the commercial fisheries, provincial government interests are the concern of the Nova Scotia Department of Fisheries. The Fishermen's Loan Board is administered by that Department and the Industrial Loan Board by the Nova Scotia Department of Trade and Industry; the first makes loans to fishermen for the purchase of boats and engines and the second makes loans for the construction or improvement of fish processing plants. Fisheries engineers perform inspection and survey duties for the Loan Boards and provide technical assistance and advice to loan applicants and others in the fisheries and allied industries, notably the boatbuilding industry. Instructors conduct courses for fishermen in the care and maintenance of marine engines, in basic navigation and in the design, construction and maintenance of gear. The on-course instruction is supplemented frequently by informal on-the-spot assistance to smaller groups who find themselves in need of technical help with particular problems. The Nova Scotia Department of Fisheries, with the financial and/or technical assistance of the federal Department of Fisheries and Forestry, organizes and conducts explorations of fishing grounds for new resources and studies the adaptability of new, improved gear and methods.

Sport Fisheries.—In recent years, Nova Scotia, through the Wildlife Conservation Division of its Department of Lands and Forests, has spent a considerable amount of money on management and research in certain lakes and streams in the province with a view to aiding the Atlantic salmon and trout fishery. A continuing program of lake and stream investigations was begun in 1961 in order to obtain information useful in the formulation of a fish management program for the future. A system of rearing ponds, capable of producing 100,000 yearling speckled trout annually, has been established on the Moser River in Halifax County. Several projects dealing with reclamation, farm ponds, rainbow trout and smallmouth bass are also being conducted. A full-time fisheries biologist is employed by the Division.

The Nova Scotia Travel Bureau, a division of the provincial Department of Trade and Industry, has been promoting saltwater sport fishing by conducting a series of courses for captains contemplating the establishment of charter services, awarding prizes to sportsmen with the largest tuna and bass catches of the season, sponsoring the International Tuna Cup Match and the Intercollegiate Game Fish Seminar and Fishing Match, and publishing a brochure listing charter boats available in the province.

New Brunswick.—Commercial fishing is one of the most important basic industries of New Brunswick, employing about 6,200 fishermen with annual earnings of \$16,000,000 and 3,000 plant workers. The annual marketed value of fish products is about \$65,000,000 of which 90 p.c. is exported to the United States. New Brunswick's commercial fisheries, both tidal and inland, are under the legislative jurisdiction of the federal Department of Fisheries and Forestry; angling in Crown waters is the responsibility of the provincial Department of Natural Resources.

The New Brunswick Department of Fisheries, established in 1963, has four Branches. The *General Administration Branch* is responsible for personnel, accounting and field staff and supervises the regional offices covering the three main fishing areas of the province. It maintains close liaison with various government departments and agencies, both federal and provincial, to assist the fishing industry in the province.

The functions of the *Boatbuilding and Maintenance Branch*, with a personnel consisting of marine engineers, a naval architect and boat inspectors, include the study, modification and approval of plans and specifications of the numerous types and classes of fishing vessels employed in the fisheries of the province as well as the inspection of vessels financed by the Fishermen's Loan Board. New designs are being introduced and the trend to larger, more modern vessels is becoming more prevalent. Combination multi-purpose vessels have proved profitable to both inshore and offshore fishermen. Under the leadership of the experienced staff of this Branch, New Brunswick fishermen are now operating a fleet geared for diversified operation, permitting the inexpensive and easy conversion from one fishery operation to more lucrative operations throughout the season. A new 600-ton capacity marine railway dry dock was put into operation at Bas Caraquet in November 1968 to service the expanding offshore fishing fleet of northeast New Brunswick. A 200-ton transfer system adjacent to the dry dock provides storage facilities for smaller vessels to lay up for the winter or to undergo major repairs. Shipbuilding and repairing facilities, at present under construction on a site adjacent to the slip, will provide ready and adequate service to an expanding offshore fishing fleet.

The *Exploratory Fishing and Education Branch* continues the experimental and exploratory fishing and fish processing projects that have been carried on for many years in co-operation with the Industrial Development Service of the federal Department of Fisheries and Forestry. Technical and financial assistance are made available to the New Brunswick Department of Fisheries for projects undertaken toward modernizing fishing and processing methods, experimenting with new types of fish-catching equipment and demonstrating its operation to fishermen, and exploring and developing hitherto unexploited or under-exploited species of molluscs, crustaceans, fishes and seaweeds. Results of this extensive experimental work and research studies include the establishment of queen crab, shrimp,

tuna and eel fisheries in New Brunswick. During 1969-70, nine fisheries development projects were undertaken on a shared-cost basis with the federal Department of Fisheries and Forestry. Of particular interest was the queen crab development which included the designing and construction of special equipment. In 1969, 75 vessels fished this deepsea delicacy and several million pounds were processed in 20 crab plants. Shrimp exploration was started in the Gulf of St. Lawrence in 1966 with encouraging results; seven plants are now processing shrimps from the Bay of Fundy and the Gulf of St. Lawrence. Other developments such as Irish moss, eels, mackerel, scallops and smelts are also processing very satisfactorily. The Branch operates a modern school of fisheries at Caraquet where, in 1968-69, 151 fishermen took training in the various phases of their trade. The school program includes navigation, administration, marine biology, oceanography, radiotelephone, metal and woodworking, arithmetic and languages and other related subjects and graduates may receive practical training aboard large modern fishing vessels under a joint federal-provincial program of technical upgrading. Following a few weeks of training, apprentices are taken on as regular crew members.

The *Fish Inspection and Marketing Branch* is responsible for the administration of the New Brunswick Fish Inspection Act and Regulations. For greater effectiveness and to avoid duplication of personnel, 30 Fish Inspectors of the federal Department of Fisheries and Forestry, Maritimes Area, carry out the application of the New Brunswick Fish Inspection Act and Regulations. The Branch is active in promoting the expansion and modernization of existing plants as well as the establishment of additional fish processing plants in the province. Its efforts are aimed at studying existing markets and developing new ones for fishery products at home and abroad in collaboration with other government agencies, federal and provincial. The Branch is also responsible for publicity and information to the industry and the general public.

The *Fishermen's Loan Board of New Brunswick* is a body corporate operating under the jurisdiction of the Minister of Fisheries. It was established in 1946 and is now operating under the Fishermen's Loan Board Act of 1952 and the regulations of Nov. 1, 1963. Its function is to improve and develop the fishing industry of the province by providing adequate financial assistance to individual fishermen, groups, associations, processing firms and corporations, at a moderate rate of interest to construct modern fishing vessels, make major repairs and purchase engines and equipment. Since its inception the Board has granted 2,076 loans to New Brunswick fishermen for a total of over \$26,721,000; outstanding loans amounted to \$11,000,000 in 1969.

Loans are repayable within a five-year period on small inshore fishing vessels: repayment schedules on large trawlers may extend to 15 years, based on the gross proceeds of the catch. Most of the new fishing vessels being built for fishermen and fish processing firms in the province are financed by the Board. The Board acts as agent for the federal Department of Fisheries and Forestry financial assistance program granted to owners of new fishing vessels, which are not eligible for the shipbuilding subsidy granted by the federal Department of Industry.

Sport Fisheries.—Sport fishing contributes substantially to the economy of the province. Great Atlantic salmon rivers like the Miramichi, the Restigouche and the St. John are known around the world for their prolific production of this majestic game fish and attract many thousands of tourists to the province each year. Anglers catch as many as 50,000 salmon a year in the Miramichi system alone. Many other species are also sought after by both residents and non-residents in the hundreds of streams, rivers and lakes of the province.

Quebec.—The sea fisheries of Quebec are administered by the Fisheries Branch of the Quebec Department of Industry and Commerce, which carries on its functions through three Divisions—Research, Economics and Technical Services. The Research Division is involved in experimental work and study on the biological aspects of commercial fish species, on the processing of seafoods for marketing, and on the testing of new types of fishing gear. The work of the Biological Service of the Division is facilitated by the availability of

extensive research equipment at the Marine Biology Station in Grande Rivière and at the Aquarium in Quebec City. The latter also fulfils an information role through its displays, in 60 large tanks, of many freshwater and saltwater species.

One of the main functions of the Economics Division is to administer the loan program, which applies to construction and repair of boats, as well as to administer other forms of government assistance. In 1969, the active offshore fishing fleet included three 166-foot and three 129-foot steel trawlers, one 100-foot dragger, 15 87-foot trawlers, 14 82-foot trawlers, 74 60-to-65-foot trawlers and 48 45-to-54-foot "gaspésiennes" and long-liners. As at Mar. 31, 1970, owners of these fishing vessels held outstanding government loans, for both construction and repair, totalling nearly \$10,000,000. This represents an improvement of some \$2,000,000 over the situation of a year earlier. The Economics Division also carries out socio-economic analyses which are necessary to the government in planning action in the field of fisheries and in ensuring the efficiency of development projects.

The Technical Services Division conducts regular inspections of fishing vessels, keeps close supervision over the operations of maintenance and repair crews and also supervises the tenders submitted to fishermen by shipyards or other suppliers. Its protective service issues fishing permits, conducts land and sea patrols and investigates infractions of regulations. The Division includes an Engineering Service which draws up plans and specifications related to improvements in fishing equipment and a Refrigeration Service which administers Fisheries Branch equipment, including 39 cold storage warehouses with a daily freezing capacity of 500 tons and a storage capacity of 25,000,000 lb., 95 stations in small fishing ports where fish is kept in good condition awaiting pickup by truck or boat, and a number of other service or production establishments.

Fisheries Branch administration is centralized in Quebec City, with offices in the main fishing centres. In co-operation with the Department of Education, it conducts a training program for fishermen and producers for which it maintains a fisheries school and a training vessel. The Department of Industry and Commerce works closely with the Quebec Planning and Development Board and with the Eastern Quebec Regional Administrative Conference in the administration of various development programs, one of which is a training program designed to advance the domestic use of seafoods.

Sport Fisheries.—Sport fishing in the inland waters of Quebec is under the jurisdiction of the Department of Tourism, Fish and Game, which employs 417 full-time wardens and issues the required sport-fishing licences. Four hatcheries are maintained by the Department, where speckled trout, brown trout, rainbow trout, grey trout, ouananiche, maskinonge and salmon are reared for the restocking of lakes and streams.

Excellent fishing may be found in all provincial parks and reserves. Gaspesian and Laurentide Parks are renowned for trout fishing, and the waters of Chibougamau Reserve and La Vérendrye Park, situated on the height of land, abound in pickerel, pike, and grey and speckled trout. Eleven salmon streams are open to anglers—the Petit Saguenay River, the Laval River, the Moisie River, the Matane River, the Cap Chat River, the Ste. Anne River, the St. Jean River, the Matapédia River, the Dartmouth River, the Port Daniel River and the Petite Cascapédia.

A committee made up of directors of the Quebec Wildlife Federation makes recommendations to the provincial government concerning legislation required for the maintenance of satisfactory fishing and hunting conditions and other problems arising out of the ever-changing conditions of modern life and their effect on the wildlife of the province.

Ontario.—The fishery resources of Ontario are administered by the Fish and Wildlife Branch, Department of Lands and Forests, under the authority of the federal Fisheries Act, the Fishery Regulations for the Province of Ontario, the Ontario Game and Fish Act and the Regulations connected therewith.

Commercial Fisheries.—The commercial fishing industry in Ontario provides employment for about 2,100 persons directly and for many more indirectly, and produces an annual yield of from 45,000,000 lb. to 60,000,000 lb. of fish. The industry, although

widely scattered throughout the province, is centred chiefly on the Great Lakes, particularly Lake Erie. The principal species of fish taken commercially are perch, smelt, whitefish, pickerel, lake trout, white bass, pike, herring, chub, sheepshead, carp, catfish and bullheads, sturgeon, eel, goldeye, rock bass, sunfish and suckers. Over one hundred smaller inland lakes are commercially fished, principally those in the northwestern portion of the province, and careful management of these lakes is essential to ensure continued production.

The types of fishing boats in use vary from small craft to 70-foot tugs, and types of gear vary from gillnets, pound-nets and trap-nets, seines, trawls and baited hooks to small hand-operated seines and dip-nets. Fishing methods and equipment have been modernized extensively during the past few years. Diesel-driven steel-hull tugs have replaced steam-driven wooden tugs, such aids as depth-sounding devices, radar, ship-to-shore and ship-to-ship communications have been developed, and a better knowledge of the fish and their movements has been established from biological research findings. Modern icing facilities and transportation methods are in use as well as new types of fishing gear. Trawling has proved very efficient in harvesting smelt on a year-round basis in Lake Erie.

Most Ontario fishermen are organized into various local associations. Many of these associations are, in turn, represented by the Ontario Council of Commercial Fisheries which performs important services to the industry. The Ontario Fishermen's Co-operative and its member groups are of importance also in the organization of the fishery in the province.

Sport Fisheries.—Angling in Ontario is rapidly becoming one of the major industries of the province. With an estimated freshwater area of some 68,490 sq. miles, the province is one of the most attractive fishing areas on the Continent. Excellent angling opportunities are available for such prized fish as brook, rainbow, lake and brown trout, walleye, smallmouth and largemouth bass, pike and maskinonge. It is difficult to measure the total value of the sport fishing industry to the province but the annual revenue from the sale of angling licences alone is in the neighbourhood of \$5,900,000. The management of this valuable resource is administered by a well-trained field staff of conservation officers and biologists located in the 21 forest districts of the province.

Provincial Hatcheries.—Ontario operates 16 hatcheries and rearing stations, the main species reared in these operations being brook trout, rainbow trout, lake trout, "splake", smallmouth and largemouth bass, and maskinonge. A program of modernization of the hatchery system is being undertaken—the Normandale Hatchery in Norfolk County and the North Bay Station have recently been completely renovated.

Fisheries Research.—Research in Ontario is carried on in the Great Lakes and in inland waters. At the South Bay Mouth Station on Manitoulin Island in Lake Huron, Sault Ste Marie on Lake Superior, Wheatley on Lake Erie, and Glenora on the Bay of Quinte on Lake Ontario, fishery biological stations are operated for the investigation and study of the commercial and sport fisheries on the respective lakes. In Algonquin Park, detailed studies concerning lake trout, smallmouth bass and brook trout are in progress and management techniques are being tested against the background of a creel census which has been continuous since 1936. Studies are also being conducted on walleye, parasitology and limnology. A selective breeding experiment concerning the hybrid (splake) of lake trout and brook trout is progressing; the deep-swimming character of the lake trout and the character of maturity at early age of the brook trout are those being selected for combination in the hybrid. Investigations include the study of exotic species of fish for use in the Great Lakes. Kokanee (sockeye salmon) plantings have been made in Lake Ontario and Lake Huron.

Manitoba.—Manitoba's interior location belies the importance of its fisheries resources which stem from an abundance of water comprising 40,000 sq. miles of lakes and streams covering 16 p.c. of the area of the province. These resources are utilized for commercial, sport and domestic purposes.

The commercial fishery in 1968-69 produced nearly 26,000,000 lb. of fish, an increase of 4,900,000 lb. over the previous year. Northern waters contributed 9,500,000 lb. (37 p.c.), followed by Lake Winnipeg with 7,900,000 lb. (30 p.c.) and Lakes Winnipegosis and Manitoba with 4,100,000 lb. (16 p.c.) and 3,800,000 lb. (15 p.c.), respectively. Other southern lakes were responsible for the remainder of the commercial production. The commercial fishery utilizes an estimated 22,000 sq. miles of water. Most of the 145 water bodies commercially fished in northern Manitoba are each less than 50 sq. miles but total 8,000 sq. miles. Lakes Winnipeg, Winnipegosis and Manitoba have a combined area of 13,000 sq. miles and other commercially fished waters in southern Manitoba are 1,000 sq. miles in extent.

Fifteen species or groups of species enter into the commercial catch. Six species, however, predominate. In 1968-69, pike contributed 5,350,000 lb. followed closely by whitefish with 5,290,000 lb. Suckers, saugers and pickerel (walleye) contributed from 3,000,000 to nearly 5,000,000 lb. each. The tullibee production was 1,000,000 lb. The value to the fishermen was \$3,300,000. Most of the commercial catch is exported to the United States. Gillnets are the main fishing gear although there is a limited use of trap-nets on Lake Winnipeg. About 2,300 persons were employed during the open-water fishery and 1,700 took part in winter fishing. The value of equipment totalled \$3,000,000.

The sport fishery is increasing in importance, with walleye, pike, perch and several kinds of trout being the principal sport fishes. The number of angling licences sold in 1968-69 totalled 119,852 of which 98,896 were purchased by residents of Canada. An estimated 13,000,000 lb. of fish are caught by anglers each year. A Master Angler Award is given to fishermen who catch fish of trophy size. In 1968-69, 1,183 awards were issued for 16 species of fish, most of them (478) for pike. Fish is harvested by many native people for local use. The quantity taken in this manner is unknown but probably is considerable.

Fisheries administration is under the control of the Department of Mines and Natural Resources. Field administration is divided into four regions. Conservation Officers enforce both the commercial and the angling regulations and carry out numerous other duties in connection with fisheries management. Professionally trained biologists carry out a continuing program of studies which not only monitor the resource but also extend the knowledge of it. Fish culture plays an important role in fisheries management. Pickerel hatcheries are located on Lakes Winnipegosis and Manitoba. Lake Winnipeg has two hatcheries, one at Dauphin River and the other at Grand Rapids. A trout hatchery is located in the Whiteshell Provincial Park. Two temporary facilities for collection of spawn are also used.

Saskatchewan.—Approximately 32,000 sq. miles of water, about one eighth of Saskatchewan's area, provide the basis for a fishery resource that contributes much to the economic and recreational activity of the province. The Fisheries Branch of the Department of Natural Resources, with head office at Prince Albert, administers the fisheries. The Branch has three main Divisions—Management, Research and Fish Culture—which are responsible for planning policies; developing programs to ensure the proper management and utilization of the fishery resource; interpreting and explaining policies, programs and regulations; administering the Acts and Regulations (both federal and provincial); and adapting regulations to meet changing conditions. The objective is to encourage efficient multi-use of the fishery, taking into consideration the interests of the various groups concerned—commercial fishermen, mink ranchers, anglers and the public generally.

In 1968-69 the Saskatchewan commercial fishery harvested approximately 11,000,000 lb. of fish, having a landed value to the fishermen of \$1,400,000 and a market value of \$2,800,000. In addition, a commercial harvest of 315,000 lb. of brine shrimp and brine shrimp eggs was taken from several saline lakes in southern Saskatchewan. These are processed for sale to fish hobbyists. Although low fur prices continued to exert a depressing influence on mink ranching in Saskatchewan, 31 ranches in 1968 harvested approximately 4,000,000 lb. of fish to feed 6,600 mink.

Saskatchewan continues to produce some of the finest sport fishing in Canada, as evidenced by the increasing number of anglers licensed. In 1968 a record total of 130,442 angling licences were sold, representing a 14-p.c. increase in sales over 1967. As in previous years, outstanding numbers of northern pike, lake trout, walleye, brook trout, brown trout and rainbow trout were taken.

A continuous program of inventory and examination of sport fishing stocks is maintained by the Management Division of the Fisheries Branch. During 1968, 161 waters were examined. The stocked game trout program continues to grow in popularity; to date, 31 lakes and 40 streams and rivers have been stocked with various species of trout and salmon.

The Fish Research Division conducts biological surveys on most of the large lakes and on many smaller water bodies and streams in the province to provide information for the development of fisheries management policies and programs. The current program is designed to determine productivity of water bodies, secure information on abundance and relationship of fish species, investigate ecology and assess factors affecting environment of fish, develop techniques to achieve maximum harvest of fish populations without prejudice to continued production, and develop techniques to facilitate rehabilitation and stocking of small water bodies. Limnological and fisheries investigations are continuing on recently established reservoirs on the South Saskatchewan River, including Lake Diefenbaker. The long-term creel census on Lac la Ronge is being supplemented by an intensive investigation of the life history and ecology of northern pike. Additional creel censuses are also under way on Nemeiben Lake, Puskwakau River and the Qu'Appelle Lakes.

The provincial hatchery at Fort Qu'Appelle reared over 12,600,000 fish in 1968 for stocking in 98 waters.

Alberta.—Commercial and sport fishing are administered by the Fish and Wildlife Division of the Department of Lands and Forests, under the authority of the Fisheries Act (Canada) and the Fish Marketing Act (Alberta). Production of commercial fish from Alberta's 6,485 sq. miles of fresh water for the year ended Mar. 31, 1969, was 11,986,639 lb. Landed value of the catch was \$932,940 and marketed value amounted to \$1,466,370. Lake whitefish is the most valuable commercially caught fish; it accounted for 51 p.c. of the total marketed value but represented only 17 p.c. of the total landings. Production of tullibee (cisco), primarily used for animal food, recovered to a level exceeding that of 1966-67; it remained in second place in value among the fish marketed. Other species taken, in order of marketed value, were pike, walleye (pickerel), burbot (ling), perch, lake trout and suckers. Of the total quantity taken, 2,261,587 lb. were marketed outside the province and, of this amount, 1,526,746 lb. went to the United States.

Sport Fisheries.—A non-resident non-Canadian angling licence was introduced in 1969, with initial sales of 1,621. Resident and non-resident Canadian licence sales increased from 136,693 in the year ended Mar. 31, 1968 (including sales to non-resident non-Canadians) to 139,253 in 1968-69. Fish hatchery facilities in Calgary and the rearing station at Raven produced 3,456,955 trout and kokanee for stocking in provincial waters. Rainbow trout accounted for 85 p.c. of the total and lake trout, brown trout, kokanee and golden trout made up the remainder. In addition, 1,161,200 walleye, perch and pike were stocked in various locations where winterkill had removed resident populations or where new introductions were required.

In 1969, headquarters biological staff moved into new laboratory facilities in the O.S. Longman Building in Edmonton and a small pollution research section was established. A program to develop a trained field staff of technicians was begun with the placement of a fishery technician in Lethbridge.

British Columbia.—A Fisheries Office, which was organized in 1901-02 and became very active in fish culture work, building and operating fish hatcheries and instituting scientific research into various fishery problems, was superseded in 1917 by the Department

of Fisheries which in turn was superseded in 1957 by the Department of Recreation and Conservation. Today, the Commercial Fisheries Branch of the Department of Recreation and Conservation is the provincial organization concerned with commercial fisheries. Broadly speaking, the administrative and regulative jurisdiction over the fisheries of British Columbia rests with the federal authority. The ownership of the fisheries in the non-tidal waters is vested in the Crown in the right of the province, as are the shell fisheries such as oyster fishing and clam fishing in tidal waters. The province administers these fisheries although the regulations covering them are made under federal Order in Council on the advice and recommendation of the province.

The provincial Fisheries Act provides for the taxation of the fisheries and, under civil and property rights, for the regulation and control of the various fish processing plants under a system of licensing. The commercial harvesting of oysters and marine aquatic plants is regulated by provincial permits and licences. Provision is also made for arbitration of disputes regarding fish prices that may arise between the fishermen and operators of the various licensed plants. The administration of the Act involves the collection of revenue and the supervision of plant operations.

Regulation and administration of net fishing in the non-tidal waters of the province, including commercial fishing and authority for regulation of the game fisheries in non-tidal waters, is vested in the Fish and Wildlife Branch which operates a number of trout hatcheries and egg-taking stations for re-stocking purposes.

The Branch co-operates closely with the Fisheries Research Board of Canada. The biological research into those species of shellfish over which the province has control, principally oysters and clams as well as marine plants, is conducted by the Fisheries Research Board of Canada at the Pacific Biological Station, Nanaimo, B.C., under agreement with the federal and provincial authorities. The object of this research is to encourage the industry to produce better products more economically and to enable the Commercial Fisheries Branch to regulate the various species so that maximum exploitation may be obtained on a sustained-yield basis.

PART II.—FURS

Section 1.—The Fur Industry*

The value of raw furs produced in Canada in the 1968-69 season amounted to \$41,589,086, an increase of 13.8 p.c. over the 1967-68 output almost entirely due to higher returns for wildlife pelts. The value of the pelts from fur farms was \$22,925,933, largely unchanged from the previous season; farm production accounted for 55.1 p.c. of the total value.

Fur Trapping.—Although many changes have occurred in the fur industry since the era when furs from the wilds dominated the market, the trapper is still an important figure. In the 1968-69 season some 40,000 Canadians participated in fur trapping activities which yielded returns totalling \$18,663,153. Trapping is carried on in all the provinces and territories, the principal producers in 1968-69, in order of importance, being Ontario (26.3 p.c.), Quebec (15.5 p.c.), Manitoba (13.8 p.c.) and Alberta (10.4 p.c.).

Although the task of tending the trapline and preparing the catch for the market has altered little, the advent of the snowmobile has introduced a new dimension into the North. In many areas the trappers have disposed of their dog teams and now use snowmobiles to make the rounds of their traplines. These machines take much of the drudgery out of the long winter trips and eliminate the expense of feeding dogs through the summer months. Gains in this direction must, however, be balanced against some loss of reliability. The possibility of mechanical failure, perhaps far out on the trapline, is accentuated by the low

* Prepared by the Livestock Division, Production and Marketing Branch, Canada Department of Agriculture, Ottawa.

temperatures encountered throughout the winter months. To obviate the serious consequences which may attend such failure, trappers operating on adjoining traplines often work together and arrange to meet regularly at specified locations.

Fur Farming.—Almost two thirds of Canada's fur production now comes from fur farms. Mink is by far the most important species raised and this animal accounts for 99 p.c. of the total value of pelts produced on farms. Other animals raised on fur farms are chinchilla, fox and nutria.

Mink.—The rather brief history of mink farming records a steady growth in this industry from its beginnings in the early 1900s; the following figures depict the recent growth:—

<i>Year</i>	<i>Pelt Production</i>	<i>Average Realization</i>	<i>Year</i>	<i>Pelt Production</i>	<i>Average Realization</i>
	No.	\$		No.	\$
1930.....	3,284	10.52	1965.....	1,624,154	17.41
1940.....	229,202	9.64	1966.....	1,810,691	12.41
1950.....	589,352	17.08	1967.....	1,967,323	11.58
1960.....	1,203,853	14.03	1968.....	1,667,945	13.60

The development of mink farming in Canada was paralleled and in some instances exceeded in a number of other countries, and by 1965 the world output amounted to around 23,000,000 pelts annually. Throughout this period consumer demand for mink kept pace with and sometimes surpassed the expanding production, and carry-overs of unsold mink pelts at the auction level, from one season to another, were virtually unknown. From 1966 onwards the ability of the world market to absorb the increasing annual production became less assured and in the later 1960s, average realizations for most of the mutation pelts declined to the point where producers were unable to recover their costs. The weaker market may be attributed to a number of factors the most important of which is that, after many years of expansion, the demand for mink in present markets (notably North America and continental Europe) appears to have levelled off. As a result of the unfavourable returns, a number of Canadian and American mink farmers have ceased operations in recent years. For the immediate future the resulting decline in the number of pelts available might put fresh life in the market, but over the longer term there is a pressing need to develop new markets for this product.

Chinchilla.—British Columbia, Alberta, Ontario and Quebec account for most of the chinchilla pelts produced in Canada. The following figures show the production, average prices and the number of farms in recent years:—

<i>Year</i>	<i>Pelt Production</i>	<i>Average Realization</i>	<i>Farms at Dec. 31</i>
	No.	\$	No.
1955.....	1,742	27.50	669
1960.....	9,067	13.06	531
1965.....	17,109	13.18	556
1966.....	19,133	11.88	653
1967.....	17,368	11.11	937
1968.....	18,854	9.97	1,395

In recent years the number of chinchilla farms has increased sharply. Many of the new breeders lack experience in the management of chinchillas and the lower average pelt prices registered since 1966 reflect, to some extent, this inexperience.

Fox.—In 1968, foxes were raised on 40 Canadian farms, mainly in Eastern Canada, and the breeding herd totalled 1,069 animals (male and female); production amounted to 1,282 pelts with an average value of \$36.34. Higher returns realized since 1964 have encouraged raisers to hold over more breeding animals but this increase has been modest since there is some question as to whether present price levels will be sustained.

Fur Marketing.—The bulk of the Canadian fur crop is marketed, raw or undressed, through seven fur auction firms located in Montreal, North Bay, Winnipeg, Regina, Edmonton and Vancouver. The marketing season extends from December each year through to the following June, or until the crop has been sold. The furs are sold through competitive bidding, by the fur auction firms, which charge a commission of, generally, around 5 p.c. of the gross realization for their services. These services include classifying the pelts and readying them for sale in "lots" which are matched as to size, colour and fur quality. The fur auctions advertise their scheduled sales widely in Canada, the United States and overseas.

Canadian furs are highly prized in world markets and buyers from many countries attend the auctions, purchasing for their own accounts or on behalf of firms anywhere in the world. In 1969 the value of exports of raw Canadian furs amounted to over \$33,000,000 and the most important customers were the United States (\$14,700,000), the United Kingdom (\$9,600,000), Switzerland (\$3,400,000), West Germany (\$2,500,000) and Italy (\$1,200,000). The principal species exported were ranch mink (\$13,600,000), beaver (\$8,600,000), seal (\$2,500,000), muskrat (\$1,900,000) and wild mink (\$1,600,000).

Section 2.—Fur Statistics

Subsection 1.—Fur Production and Trade*

Total Fur Production.—Annual figures of raw fur production, available since 1920, are now based on figures of royalties, export taxes, etc., provided by the game departments of all provinces except Prince Edward Island; those for Prince Edward Island are based on returns by fur dealers in that province.

Table 1 shows the fluctuating trend of the fur industry over the past two decades. It should be mentioned that, from 1964 on, the figures include hair and fur seal pelts, which in 1969 had a value of \$2,409,251. The proportion of the total value of pelts sold from fur farms declined to 55 p.c. in 1969, the lowest since 1955.

¹ Includes seal pelts.

Table 2 shows the provincial distribution of fur production. Ontario continues to lead the provinces and territories in this respect, accounting for 26.6 p.c. of the total value in the 1968-69 season compared with 22.3 p.c. in the previous season. Increased percentages were also shown by Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick, Quebec and Northwest Territories.

* Prepared by the Agriculture Division, Dominion Bureau of Statistics.

¹ Totals include pelts and values not allocated to a province or territory, mainly Alaska fur seal and Atlantic Coast hair seal.

Wild Fur Production.—The principal kinds of wild fur pelts taken, according to value, in 1968-69 were beaver, seal, muskrat and mink. These four kinds accounted for 77 p.c. of the total value of wild pelts produced, beaver alone accounting for 43 p.c. The number of beaver pelts produced was somewhat higher than in the previous year and the average value per pelt increased from \$15.05 to \$18.40. In fact, the average value of every kind of pelt except fox (not specified), marten, rabbit, skunk and squirrel, was higher in 1968-69 than in 1967-68.

Fur Farm Production.—Mink accounts for about 99 p.c. of the total value of fur farm production. In 1968 the number of mink pelts taken continued upward, reaching 1,668,000 with a value of \$22,690,000. Mink farms decreased in number from 1,359 to 1,147 but the number of animals on those farms at year-end was 641,857 compared with 650,929 a year earlier. Chinchilla farms increased in number from 937 to 1,395 and the number of animals from 72,952 to 83,033. In 1968, 26 farms raising nutria reported 1,068 animals and 40 farms raising fox had 1,069 animals.

Exports and Imports.—The Canadian fur trade, both export and import, is mostly in undressed furs, the value of dressed and manufactured furs going out of or coming into Canada being a comparatively small proportion of the total. Canadian fur exports consist largely of those produced in greatest abundance, mink being by far the most valuable followed by beaver, seal, fox, and muskrat. Mink, Persian lamb, dressed seal, dressed sheep and lamb, fox, and raccoon make up a large part of the imports. Exports and imports of furs, undressed, dressed and manufactured, to and from Britain, the United States and all countries, are given for the years 1968 and 1969 in Table 6.

Subsection 2.—The Fur Processing Industry

The general term "fur processing" includes the fur dressing and dyeing industry and the fur goods industry. The former is concerned with the dressing or dyeing of pelts on a custom basis and the latter is a manufacturing industry that makes up fur goods such as coats, scarves and gloves. Tables 7 and 8 give selected statistics for these industries on the "total activity" basis (see Chapter XVI on Manufactures) for 1964-68. In 1968, the fur dressing and dyeing industry processed the following major types of pelts: mink (all types) 1,764,870, muskrat 942,443, raccoon 686,330 and fox 148,098. Comparable figures for 1967 were 1,771,111, 792,476, 531,844 and 108,470, respectively.

Section 3.—Provincial and Territorial Fur Resource Management*

Most of the fur resources of the provinces and territories of Canada are under the administration of their respective governments. Exceptions include those resources within the boundaries of the national parks and the Indian reserves, which are under the administration of the Federal Government. The Canadian Wildlife Service of the Department of Indian Affairs and Northern Development is responsible for all Federal Government interests in wildlife resources except for those related to Indian affairs, which are administered by the Indian Affairs Branch of the same Department. The Canadian Wildlife

* Prepared by the respective provincial and federal departments responsible for fur resource management.

The fresh and vigorous approach of Canada's designers working with many Canadian wild and ranch-bred furs is creating an exciting new interest in fur fashions, although fur craftsmanship in Canada has always ranked with the best. The centre coat—a muskrat midi with raccoon collar and hem trim—is flanked on the left by a Canada Majestic violet mink with wide notched collar and darker mink hem, and on the right by a Canada Majestic triple-pearl mink with waist trim and jewelled buttons.

Service co-operates with provincial governments and other agencies concerned and handles federal interests in relevant national and international problems (see pp. 56-58). Provincial fur resource management practices are discussed in the following paragraphs.

Newfoundland.—The wild fur industry in Newfoundland, as elsewhere, has been characterized by short-term instability and long-term decline. In general, the price of furs has declined in the past decade and, since the supply of trappers is partially determined by the profit motive, the number of trappers has also declined. As a result, the fur bearers of the province are now considered to be under-harvested. Because trapping is no longer profitable for the casual trapper and only large harvests and excellent pelt preparation can repay a trapper for his effort, the maintenance of trapping in Newfoundland requires that the resource be divided among a select group of professional trappers.

Research and management of the Newfoundland wild fur industry is at present in progress in an effort to exploit this resource more fully. All beaver were harvested on the Island in the 1970 season under registered trapline management, which allows one beaver to be taken from each active lodge; in Labrador the quota is 20 beaver per trapper. There is no quota for other furbearers. More than \$100,000 worth of wild fur was harvested in 1969, about half of which was for beaver. Otter and fox were the next largest contributors, at about \$30,000 and \$25,000, respectively. A harvest of about 3,000 beaver and 1,000 otter has been stable for the past several years.

Nova Scotia.—Nova Scotia's wild furbearers include beaver, muskrat, mink, otter, wildcat, lynx, fox, raccoon and weasel and the trapping of these animals provides supplementary income for some 3,500 persons who harvest from \$100,000 to \$200,000 worth of wild furs each year. The value, of course, depends on the numbers of each fur species available and on fur prices, both of which are subject to marked variations.

The beaver, once almost extinct in the province, is now the most valuable fur bearer taken. A \$2 licence is required by residents to trap a limited number of beavers (five to 20) between Nov. 1 and Jan. 15. No licence is required to trap other fur bearers, although a royalty must be paid to the province for each pelt of mink, otter, beaver, lynx and muskrat exported. These animals may be taken between Nov. 1 and Mar. 15 (depending on species).

To increase knowledge of the beaver as a preparation for better management of its population, behaviour, feeding, movement and reproduction, studies are being conducted in the Tobieatic Wildlife Management Area in western Nova Scotia and in Thomson Station Sanctuary in Cumberland County (northeastern mainland Nova Scotia). In addition, data on reproduction, size, age, parasites and disease are collected from beavers harvested by trappers in all parts of the province.

The Trappers' Association of Nova Scotia, including several county trappers' associations as well as trappers from all parts of the province, has been organized so that the men closest to the fur resource may have a say in its wise use and management. One of the aims of the Association is to promote improved handling and marketing of the raw furs taken by trappers so as to upgrade over-all fur quality and thus command more profitable market prices for trappers.

New Brunswick.—In New Brunswick, the harvest of wild fur bearing animals is carried out mainly by persons who trap only on a part-time basis. Between 3,000 and 4,000 residents of the province annually supplement their incomes by trapping for beaver, bobcat, fisher, fox, marten, mink, muskrat, otter, raccoon, skunk, snowshoe hare, squirrel and weasel. However, beaver and muskrat are the two most important species.

During the early 1900s, beavers became scarce in New Brunswick but, as a result of protection, they rapidly increased in numbers. The first open season in over 20 years was declared in 1944 and there has been an open season on beaver every year since 1953, the annual catch ranging from 7,000 to 10,000 pelts. There is no limit on beaver. In fact, damage caused by these animals to farm land, woodlots, highways and railways is of concern. The reproductive performance of the beaver is currently under investigation in New Brunswick.

Investigations are also continuing into the ecology of the muskrat, about 24,000 of which are harvested each year. The trapping of fisher and marten was permitted during the 1964-65 trapping season for the first time since 1946 and up to 1969-70 about 150 fisher and 200 marten have been taken each year. These animals, found mainly in the northern part of the province, appear to be increasing in number and their range is extending southward. During the winters of 1966, 1967 and 1968, a number of fisher were live-trapped and released in the Fundy Mountains in the southeastern part of the province in an attempt to re-establish them there. Mink and otter are not abundant in New Brunswick but during the fall trapping season the catches range from 1,000 to 1,800 for mink and from 200 to 350 for otter.

Provincial legislation allows for changes in the trapping seasons to be made on short notice. Thus, the seasons may be manipulated to allow for the most efficient and practical utilization of the fur resources of the province.

Quebec.—The fur trade has been of considerable importance to Quebec since the earliest days of New France and the province still ranks among Canada's prime fur producers. At present, the most important native species, in order of value, are beaver, Arctic fox, muskrat, mink, lynx, seal, otter and marten.

Wild fur management began in 1932 when a Hudson's Bay Company factor leased a private reserve at Rupert House. The Company took over administration of this reserve, and a second, at Nottoway House, was leased by the Company in 1938. Strict conservation measures were enforced within the two reserves and proved so successful that the provincial government took over their administration and later set aside other Crown lands for the

exclusive use of Indian trappers. Ten reserves are now under conservation: Rupert House, 7,875 sq. miles; Nottoway, 11,700 sq. miles; Vieux Comptoir, 19,525 sq. miles; Fort Georges, 34,150 sq. miles; Abitibi, 30,475 sq. miles; Great Victoria Lake, 7,825 sq. miles; Mistassini, 55,300 sq. miles; Roberval, 26,925 sq. miles; Bersimis, 31,925 sq. miles; and Saguenay, 83,600 sq. miles.

A separate system of registered lands for white trappers is in force in the area of Abitibi East, Abitibi West, Rouyn-Noranda, Témiscamingue, Pontiac and part of Saguenay County. Each leaseholder has exclusive trapping rights on his lands and is subject to very strict regulation. Trapping of fur bearing animals other than beaver is not restricted either on the reserves or on registered lands, except that the general regulations dealing with protection of animals or limits on catches must be complied with. Biological studies have been undertaken recently to evaluate the results of this system.

In 1968-69, the value of wild furs to the trapper was close to \$3,000,000 which, of course, was only a fraction of the value of the finished product.

Ontario.—Legislation for the management of wild fur bearers had its beginning in Ontario with the setting of seasons in 1860 by an Act of Upper Canada. However, 32 years passed before there was any field staff to enforce the regulations and then began an era of restrictive legislation to protect species threatened by the earlier exploitation. Progress beyond the restrictive enforcement of open and closed seasons has come about only in the past 20 or 30 years. The first steps in this direction involved the setting aside of special Indian hunting areas in which non-Indians were not allowed to trap.

The registered trapline system was introduced in 1935 on a very small scale. This system is based on government recognition of the desirability of full utilization of the resource and the more efficient management that results when one individual enjoys the exclusive right to trap on such an area. In its early stages, surveyed townships were assigned as trapline areas but more explicit trapline boundaries, established in 1947-48, now cover the province and mostly follow natural physiographical features. At the same time, resident traplines were established in areas of patented land, which means most of southern Ontario; these are blocks of land on which trappers are licensed to trap, providing they make their own written agreements with the landowners. Trapline licences are renewable annually as long as the trapper meets the conditions of the regulations and continues to trap. Trappers may sell the equipment and improvements they have made on their lines and thus have a vested interest in their traplines.

In full realization that fur is a natural resource that cannot in nature be stockpiled, and is harvested on a commercial basis only, the Ontario Department of Lands and Forests has assisted the Ontario Trappers' Association to establish their fur auction at North Bay. This allows the trappers to sell furs on a competitive market and realize their full value.

Beaver continue to provide the greater part of the earnings from wild furs for Ontario's 8,000 trappers. During the 1968-69 season, 162,000 beaver pelts at an estimated value of \$2,866,000 were marketed by trappers; the total estimated value of all wild furs harvested in the province was \$4,906,000.

Manitoba.—Trapping and trading in furs is Manitoba's oldest industry and the province still produces some of the finest wild pelts in the world, the annual value of which averages about \$1,900,000. The industry continues to be of particular economic importance to the full-time white and native trappers in the northern areas and also for many part-time trappers in the southern part of the province.

When registered traplines were established nearly 30 years ago, indiscriminate trapping was all but eliminated and illegal trapping was sharply reduced, thus giving protection to both the animals and the trapline operators. The Department of Mines and Natural Resources, which administers the fur resources of the province, has been striving by area reorganization to enlarge traplines so that the trappers may earn more money to compensate for the rising cost of living. The use of snowmobiles has made it possible for them to

cover lines more thoroughly and in less time, permitting them to handle larger territories. The once-scarce beaver has been rehabilitated through years of controlled and managed harvest and is now the most valuable fur bearer taken but during the past decade new records in the production of muskrat, mink, lynx, fisher and otter have been established. A live-transplant project has been undertaken to re-stock areas where the marten has become depleted.

A trapper education program was started by the Department in 1958 to improve the general handling of furs and to achieve a certain measure of standardization in pelt care. This program has shown gratifying results and has been expanded to include improved trapping methods and the use of humane traps. A booklet, *The Manitoba Trappers' Guide*, is available from the Conservation Education Branch of the Department.

Manitoba works in close co-operation with federal and other provincial agencies in the promotion of quality furs by exhibiting collections of representative wild furs at European fairs. A Winnipeg fur auction company, one of the largest in Western Canada, serves as an important fur selling and exporting agency for Manitoba trappers and fur dealers, with buyers attending from a number of European fur centres, from the United States and from Eastern Canada.

Saskatchewan.—Before 1945, little was done to control the trapping of beaver and muskrat in Saskatchewan, other than to establish closed seasons when the fur bearers became depleted from over-trapping, and the lack of a conservation and management policy had a disastrous effect on both the fur resources and the livelihood of trappers. In 1944, the provincial government set up a committee to study trapping problems and the following year the South Saskatchewan Muskrat Trapping Program was instituted. Under this plan, individuals received exclusive rights to trap on definite land locations. Owners and occupants received first consideration, with special priority given to Indians and metis on Crown lands. Muskrat quotas were established to assure continuing populations, and marketing of pelts under government supervision was instituted.

In 1946, under federal-provincial agreement, all Crown lands north of the 53rd parallel were set up as the Northern Fur Conservation Block. Up to \$50,000 a year was to be expended over the following ten years to establish and administer conservation areas, purchase equipment, pay salaries of personnel, transplant live beaver and build dams; the Federal Government agreed to assume 60 p.c. of the cost and the province the remainder. A Fur Advisory Committee, with representation from the provincial Department of Natural Resources and the federal Indian Affairs Branch, was set up to supervise the program. Organization of conservation areas was left to the trappers. Five-man councils were elected in all districts, with Indian, metis and white trappers sharing privileges, obligations and responsibilities on an equal basis. Conservation measures and licensing regulations were initiated. In 1956, the agreement was extended for another ten years with minor changes and in 1962 a co-ordinating body was set up by the Fur Advisory Committee to promote better communications and understanding of the fur program. In 1966, the agreement was again extended until 1972 and the sharable amount was later raised to \$120,000. The northern fur conservation program in Saskatchewan has served as an important vehicle to encourage these people to plan and carry out other programs vital to their own well-being.

During the two decades of the province's fur program, security of trappers has been strengthened; fur bearer population has reached a higher general level, particularly of beaver; quotas have put trapping on a sustained-yield basis; poaching has been almost eliminated; higher water levels resulting from the comeback of beaver have improved the habitat for other wildlife; and Indian, metis and white trappers are sharing alike in the self-government of trapping areas and in fur management programs.

Alberta.—Plans have been formulated for the reorganization of the Fish and Wildlife Division of the provincial Department of Lands and Forests. Under the new set-up, a fur management section will be established to work strictly on the fur resources of the province.

More meetings will be held with registered trappers to increase the exchange of information between them and the Division's officers and a more intensive program is being initiated to eliminate as far as possible the misuse of trapping areas by certain trappers and, by amalgamation, to form trapping areas into better economic units. The Alberta Government submits pelts to the main fur exhibits in Canada and Europe, a policy that has increased the interest of foreign and Canadian buyers in Alberta furs.

British Columbia. The British Columbia wild fur resource is administered by the Fish and Wildlife Branch of the Department of Recreation and Conservation. Regulations are derived under authority of the Wildlife Act and resource use is controlled under the registered trapline system, in effect since 1926. Registered traplines are areas of Crown land allotted, for the purpose of trapping wild fur, to trappers who are resident in the province. Registration of a specific trapline is renewable on an annual basis by the trapper, subject to certain requirements of tenure aimed at conservation and sustained yield of fur species. Approximately 3,000 trappers are involved in provincial wild fur production, of whom one half are Indians. The market value of wild fur produced during the fur harvest of 1968-69 was \$649,969, with beaver, marten, squirrel and mink together comprising about 78 p.c. of the total value.

The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.

Section 1.—Canada's Mineral Industry*

The Canadian mineral industry experienced a very successful and progressive year in 1969 notwithstanding a pause in the average increase of production value recorded from 1960 to 1968 of over 8 p.c. a year. Exploration for new deposits of base metals, uranium, coal, oil and gas continued unabated in widespread areas, as did the further exploration of mineral occurrences previously recorded. Development of properties for production in 1970 and in succeeding years continued at a high rate and future development of many others was apparent as a result of a large number of production and marketing appraisals undertaken. Despite the pause in the high growth rate of Canada's value of mineral output in 1969, which was primarily the result of labour disputes in the iron ore and nickel-copper industries, the mineral and mineral processing industries remained strong and buoyant and continued to successfully compete for markets in the world's major consuming areas.

The value of Canada's mineral production in 1969, according to preliminary statistics, was \$4,690,642,200, down slightly from the all-time record of \$4,725,341,147 in 1968. Had not long strikes occurred in some major mineral commodity industries, the year's mineral production growth rate would have reached the average of nearly 8.4 p.c. a year from 1960-68 and exceeded it because of increased prices for most commodities and the continuing high rate of industrial activity in Canada's main marketing areas.

Canada produces about 60 different minerals from domestic deposits. The 10 leading minerals in 1969 contributed 79.1 p.c. of the total value of mineral output and were worth \$3,708,600,000. The 20 leading minerals of the 60 produced in Canada regularly contribute nearly 95 p.c. of the total value; in 1969 they contributed 95.1 p.c. The leading minerals were, with 1968 output shown in brackets: petroleum, \$1,010,200,000 (\$937,300,000); copper, \$574,200,000 (\$607,900,000); nickel, \$482,400,000 (\$528,200,000);

* Prepared under the direction of J. Austin, Deputy Minister of the Department of Energy, Mines and Resources, Ottawa, in the Minerals and Metals Division, Mineral Resources Branch. The statistics in the tables throughout the Chapter were compiled in the Industry Division of the Dominion Bureau of Statistics.

The Brenda copper-molybdenum mine, not far from Kelowna, is the largest of three new British Columbia copper mines to come into production in 1970. The crushing and concentrating plant is equipped to handle 24,000 tons of open-pit ore a day.

George Hunter

Indusmin's new silica processing plant at Midland, Ont., began operations in 1970. Feed for the mill comes from an extensive deposit of high-grade silica some 120 miles north of the plant and its output of 500,000 tons of product a year will be used in the glass, ceramics and chemicals industry.

iron ore, \$431,900,000 (\$532,700,000); zinc, \$364,400,000 (\$326,900,000); natural gas, \$263,600,000 (\$225,300,000); asbestos, \$196,800,000 (\$185,000,000); cement, \$171,300,000 (\$152,000,000); sand and gravel, \$130,600,000 (\$129,500,000); and silver, \$83,200,000 (\$104,100,000).

There is varied distribution of mineral production in most regions of Canada. Except for a few mineral commodity requirements, such as manganese, chromium, bauxite and tin, Canada produces nearly all of its mineral requirements and has substantial reserves to meet the ever-increasing domestic demand and to maintain its high rate of mineral and mineral-based exports. It leads the world in the production of asbestos, nickel, zinc and silver, is second in molybdenum, titanium concentrates, gypsum, uranium and potash, and stands high in the production of many other major minerals including copper, lead, iron ore, gold, platinum metals and cobalt.

The mineral industry has always been dependent, in large measure, for its well-being and growth on exports, about 60 p.c. of its output to the prime processing stage being exported. It is the country's leading resource-based industry and exports of minerals and fabricated mineral products have led all export sectors for many years. Exports of minerals and fabricated mineral products in 1969 were valued at \$3,913,078,000 compared with \$3,992,878,000 in 1968 and \$3,348,708,000 in 1967; they accounted for 27 p.c. of Canada's total commodity exports. About 60 p.c. went to the United States, 12 p.c. to Britain, 8 p.c. to Japan, and 9 p.c. to countries of the European Common Market; the remainder was shipped to many countries throughout the world as this category of exports goes to some 80 countries in all.

As a result of a continuing high rate of industrial production in the major markets of the world, the demand for higher amounts of minerals and metals remained strong and growing in 1969, with prices generally firmer. Industrial growth was particularly strong in Japan and West Germany and at moderately good rates in the United States and Canada; the same general trends are expected to continue in 1970. Britain, in recent years, has not experienced the same high rates of industrial activity as have the aforementioned market areas for Canada's minerals and mineral products but an improvement was apparent in 1969 that will probably continue. From 60 to 65 p.c. of Canadian production of crude minerals is exported, most of it to the United States, Britain, Japan and West Germany. Therefore, the well-being of the country's mineral industry is dependent largely on Canada's competitive position in those markets relative to the position of other export-oriented mineral-producing countries.

Prices of minerals and metals in 1969 were generally higher with only a few exceptions, notably elemental sulphur, silver and potash, each of which was lower because of oversupply. The supplies of most major non-ferrous metals were tight throughout the year and there were increased prices for copper, nickel, lead, zinc, aluminium, tin and platinum, the largest percentage increase being for copper. Iron ore prices remained the same, generally, throughout the year, the level having remained stable for several years, particularly in North American markets. Iron ore has been in an oversupply situation for some time but in the last quarter of 1969 there was evidence of a firming in prices that may indicate the emergence of a seller's market. Substantial price advances occurred for many of the alloying, additive, reactive and less common metals in 1969. Notable price advances took place for columbium, cobalt, chromium, molybdenum, titanium, vanadium, tungsten and zirconium and for many metals recovered as byproducts of base metal smelting and refining, such as selenium, tellurium, bismuth and the platinum group metals. The unit value of uranium production in Canada was again lower, even though there was a modest increase in production.

Of the industrial minerals group, both potash and sulphur continued in oversupply and prices tended to be lower, although the volume of production of each was higher in 1969. Asbestos remained in strong demand and prices were steady with further increases imminent as the year closed.

^a Value of Newfoundland production included from 1949.

Following the United States and the Soviet Union, Canada is the world's largest producer of diversified mineral products and leads the world in mineral exports. Minerals have always had a prominent role in the country's total economic growth and development, both economically and geographically. This has been particularly so since World War II and especially so since 1950 when the value of mineral production was 5.8 p.c. of the gross national product (GNP) of \$18,000,000,000 compared with 6.7 p.c. of \$65,700,000,000 in 1967; it declined to 6.6 p.c. of \$71,400,000,000 in 1968 and to about 6.0 p.c. of \$78,500,000,000 in 1969 largely because of lost production due to strike action at major mining and mineral processing operations.

Copper was again the leading mineral of the metallics group in 1969 although its production, both mined and refined, was lower than in 1968 because of losses incurred through labour stoppages. Mines were brought to production in several countries and many were being explored and developed for production at widely scattered locations throughout the world. The rate of discovery and development of copper deposits in Canada exceeds the

VALUE OF MINERAL PRODUCTION* AND ITS PERCENTAGE OF THE GROSS NATIONAL PRODUCT, 1935-69

* METALLICS, NON-METALLICS, FUELS, STRUCTURAL MATERIALS.

The current technical revolution in mining and associated industries has changed the concept and size of equipment as well as management techniques.

Massive ore-loading facilities, the largest in the world, are in operation at Sept Îles, Que., where ore from the Quebec-Labrador iron mines is loaded at a rate of 15,000 tons an hour.

Control panel of a modern concentrating plant where the computer is replacing the slide rule.

losses incurred through mine closures and new production is scheduled from five provinces and the Yukon Territory. The outstanding feature of the Canadian copper industry in recent years has been the development to production and the continuing discovery of large, low-grade copper and copper-molybdenum deposits in British Columbia and the possibility of a similar pattern in the Yukon Territory. Also, substantial tonnages are being found in long-established mining areas and in the more remote and unexplored areas of Ontario, Quebec and Manitoba.

Nickel production was curtailed in 1969 because of the prolonged strikes at the Ontario operations of The International Nickel Company of Canada, Limited (Inco) and Falconbridge Nickel Mines Limited, that shut off nearly 77 p.c. of Canada's production capacity. It was, however, second in value to copper among the metallics, replacing iron ore which also suffered severe production losses because of long strikes in Quebec, Labrador and

Ontario mines. Iron ore production declined from 47,400,000 tons in 1968 to 40,000,000 tons and in value from \$532,700,000 to \$431,900,000, declines of 15.6 p.c. and 18.9 p.c., respectively. There was evidence late in the year of a firming trend in iron ore prices in North American and European markets, particularly for good grade ores and especially for pellets and high grade concentrates with special properties. The iron ore situation appears to be changing from the one of abundance and oversupply that has been prevalent for several years to one of balanced supply and demand or perhaps one of shortage for preferred types.

Zinc recorded new highs in 1969 in quantity produced and value and Canada was again the world's leading mine producer. Production was 1,196,291 tons valued at \$364,400,000 compared with 1,159,392 tons valued at \$326,900,000 in 1968, the previous record for Canadian mine production of zinc. The value of lead production at \$95,400,000, compared with \$91,400,000 in 1968, was higher although production was lower at 315,032 tons compared with 340,171 tons. The value of production in 1969 was higher for bismuth, cadmium, columbium, magnesium, mercury, molybdenum, and tellurium; value was lower for antimony, cobalt, the platinum group, silver, uranium and yttrium.

The production value of industrial minerals increased to \$908,300,000 in 1969 from \$890,200,000 in the previous year; non-metallics declined slightly in value to \$447,100,000 and structural materials increased to \$461,200,000 from \$443,300,000. The industrial minerals sector is an important part of Canada's total mineral economy with output nearly doubling since 1960 and rising at about 8 p.c. a year since 1950. The five leading non-metallics in 1969 were asbestos, potash, elemental sulphur, salt and titanium-dioxide; other leading non-metallics included gypsum, sulphur in smelter gases, peat moss and sodium sulphate. Potash and elemental sulphur, recovered in the processing of sour natural gas, each increased production capacities in Saskatchewan and Alberta, respectively, but each suffered severely by conditions of oversupply and consequent lower prices in export markets. It will probably be well into the 1970s before conditions begin to improve for either commodity. Asbestos and titanium-dioxide for pigments are also primarily export-oriented for their continued well-being but their markets remained strong at improved prices. Most of the other non-metallics are dependent mainly on the domestic market and most of them recorded slightly increased production. Structural materials, consisting of clay products, cement, lime, sand and gravel, and crushed stone, are used almost entirely by the domestic construction industry and their output is therefore related directly to the rate of activity in that industry.

High school and university students work as miner-trainees below ground at Elliot Lake, Ont. Efficient operation of today's complex mining equipment requires highly skilled personnel.

The value of production of mineral fuels—coal, natural gas, natural gas byproducts, and crude petroleum—attained another record of \$1,461,400,000 from the previous year's record of \$1,342,500,000. Crude petroleum output, at \$1,010,200,000, exceeded the \$1,000,000,000-mark for the first time. Natural gas output increased substantially and that of natural gas byproducts (liquids) rose moderately; coal production declined slightly both in tonnage and value. Many significant developments occurred in the energy minerals sector of the industry that will have long-lasting influences on future production. They were varied in nature and related to both industrial and governmental matters on national and international questions including the method by which the mineral commodities can be most economically moved to markets. In 1969, Western Canada was on its way to becoming a substantial supplier of metallurgical coal to Japanese markets from large deposits being developed for production in 1970 and in subsequent years.

2.—Value of Mineral Production, by Class, 1960-69

Year	Metallics	Non-metallics	Fuels	Structural Materials	Total
	\$	\$	\$	\$	\$
1960.....	1,406,558,061	197,505,783	565,851,829	322,594,308	2,492,509,981

1968.....	2,492,599,647	446,922,191	1,342,519,863	443,269,446	4,725,341,147
1969 ^p	2,320,947,545	447,088,679	1,461,399,937	461,206,039	4,690,642,200

Capital and repair expenditure for the mining industry was \$1,448,000,000, up slightly from that of \$1,411,000,000 in 1968; the forecast expenditure for 1970 is \$1,562,000,000.

The volume of mineral production index, which measures the mining industry's absolute growth (1961=100), declined 1.8 p.c. in 1969 to 149.9 from 152.7 in 1968; the 1960-69 average annual rate of growth was 4.8 p.c. In comparison, the volume index of total industrial production increased 5 p.c. to 167.9 from 159.8 in 1968 and the average annual rate of growth in the period 1960-69 was 6.3 p.c.

3.—Quantity Indexes of Production of the Principal Mining Industries, 1960-69

(1961=100)

Mining Industry	1960	1961	1962	1963	1964	1965	1966	1967	1968	1969

Provincial and Territorial Mineral Production in 1969

Ontario has long been the leading mineral-producing province in Canada and was again the leader in 1969, although the gap between that province and Alberta, the second largest producer, closed appreciably; Ontario's proportion of the total Canadian value of mineral production declined from 28.7 p.c. in 1968 to 25.9 p.c. in 1969 while Alberta's rose from 23.1 p.c. to 25.4 p.c. The narrowing of the gap was the result of steadily higher output of petroleum and natural gas in Alberta and of production losses in Ontario caused by labour disputes in the country's two largest nickel-producing plants, both of which also produce many byproducts of their nickel-copper operations that were discontinued for a lengthy period. Following the two leading provinces were: Quebec with 15.4 p.c. of the value of output, British Columbia with 9.0 p.c., Saskatchewan 7.4 p.c., Manitoba 5.2 p.c., Newfoundland 5.1 p.c. and the other provinces and the territories ranging downward from 2.5 p.c. to 0.02 p.c.

Newfoundland.—In 1969, the value of mineral production in Newfoundland decreased by 23 p.c. to \$239,100,000 because of prolonged strikes that closed the iron-mining operations of Iron Ore Company of Canada Limited and Wabush Mines in Labrador. As a consequence, output of iron ore declined from 19,700,000 tons to 14,700,000 tons and its value from \$246,500,000 to \$179,000,000. All metallic minerals produced in the province had a value of \$217,800,000 in 1969 and made up over 91 p.c. of the total mineral value; output of copper, zinc and lead followed iron ore, in that order. Copper was produced at four mines in the Island of Newfoundland and zinc and lead were the main products at the Buchans Unit of American Smelting and Refining Company. Asbestos, the major industrial mineral produced, declined in value by \$1,700,000 because of a two-month strike in mid-year at Advocate Mines Ltd.'s open-pit operation at Baie Verte. Fluorspar value was higher at over \$3,000,000 and the value of structural materials was slightly below the 1968 figure.

Prince Edward Island.—Mineral output in this province is confined to structural materials valued at about \$1,000,000 a year, of which sand and gravel contributed 85.7 p.c. and stone 14.3 p.c. in 1969.

Nova Scotia.—The total value of mineral output in Nova Scotia was down slightly in 1969 to \$54,200,000 from \$56,900,000 in 1968. Coal, which is still the province's leading mineral in terms of value, continued its declining trend in both quantity and value, production dropping to 2,600,000 tons valued at \$21,600,000 from 3,100,000 tons valued at \$25,100,000 in the previous year. Coal was produced from nine mines and development was begun of the Lingan mine which will produce relatively low sulphur coal from a seam that dips below the ocean. Four inclined shafts will be driven and the mine will be highly mechanized, using the longwall system for extraction. Cape Breton Development Corporation, a federal government agency that took over the coal mines and related interests of Dominion Steel and Coal Corporation, Limited, completed its first full year of operation in 1969. The Corporation offered voluntary pre-retirement to 1,000 older men of the 5,800 employees in coal operations and started to lower the scale of operations to about 2,000,000 tons a year. No. 20 Colliery at Glace Bay was closed and the work force transferred to other collieries.

In 1969, the value of industrial minerals produced in the province was higher than that of mineral fuels (coal), non-metallics having a value of \$15,400,000 and structural materials \$15,800,000. The non-metallics industry is comprised almost entirely of gypsum, salt and barite production, oriented largely to the United States market.

New Brunswick.—New Brunswick's mineral production value increased in 1969 to \$98,400,000 from \$88,500,000 in the previous year; \$81,300,000 or about 83 p.c. of the total was comprised of metallics. Zinc and lead output increased appreciably but copper and silver were down slightly. Brunswick Mining and Smelting Corporation Limited, a subsidiary of Noranda Mines Limited, is by far the major base metal mining operation in the province and continued to operate two zinc-lead-copper mines and two mills near Bathurst; a zinc-lead smelter at Belledune, about 20 miles north of Bathurst, was operated by East Coast Smelting and Chemical Company Limited, also a Noranda subsidiary. Two other companies—Heath Steele Mines Limited and Nigadoo River Mines Limited—operated zinc-lead-copper mines in the Bathurst area. Heath Steele was installing equipment at year-end to expand its mill capacity from 1,600 to 3,000 tons a day.

Industrial minerals accounted for an output value of \$11,100,000 in 1969 and mineral fuels for \$5,900,000, both being lower than their 1968 values. There were no significant changes in value or development of any minerals except for coal, which contributed almost all of the output value of the mineral fuels. Following agreement between the federal and provincial governments, New Brunswick assumed management in 1968 of the coal mines at Minto so that a gradual phasing-out of the uneconomic coal industry could be undertaken. Purchase of the four remaining coal mining operations was made as a follow-up to

the Grand Lake Development Act passed by the provincial legislature in 1968. A new provincial company, N.B. Coal Limited, was incorporated to take over and manage the Minto coal operations.

Quebec.—The mineral output of Quebec in 1969 was worth \$720,100,000, which may be compared with the previous year's \$728,800,000. The loss in value of iron ore production, which declined about \$28,000,000 to \$109,400,000 due to strikes, was the main contributing factor in the decline of \$25,700,000 in metallic output to \$407,200,000. Other metallics recorded little change in value. Copper production, second to Ontario in Canada, was about the same as in 1968 notwithstanding the long shutdown from May 13 to August 19 of the 11,000-ton-a-day plant and associated smelter of Gaspé Copper Mines Limited. Several new mines began production in 1969 and other plants were being enlarged, developed or planned for the years ahead. Iron ore announcements added considerable encouragement to increased production. Sept Îles and Pointe Noire are both being enlarged so that 150,000-ton iron ore carriers, and eventually 200,000-ton carriers, can be loaded. Also of importance was the signing of contracts for the sale of iron ore concentrates to Japan and the announcement that Quebec Cartier Mining Company was studying the development of its Mount Wright iron ore property, 75 miles north of Lac Jeannine, for initial development at 5,000,000 tons a year, to be later increased to 10,000,000 tons a year.

Asbestos production from 10 mines, one of which closed in January 1969, totalled 1,336,000 tons of fibre valued at \$154,400,000 and was second to copper in terms of value. Asbestos, together with titanium dioxide output valued at \$29,100,000, comprised about 93 p.c. of total non-metallics output value. Asbestos producers in the Eastern Townships continued to expand their mine and mill capacities and to improve recovery of fibre from material milled.

Quebec, like Ontario, has a relatively mature mineral industry that is large and well-diversified with the exception of the mineral fuels—coal, crude petroleum and natural gas. However, there still remain large areas of unexplored and relatively little explored ground in the province that are favourable for mineral deposition.

Ontario.—Mineral output value in Ontario declined from the record high of \$1,355,600,000 in 1968 to \$1,214,500,000 as a result mainly of losses incurred in the metallics sector because of plant shutdowns for prolonged periods that resulted in substantial losses in nickel, copper and byproduct metals production. Labour strife at some iron ore production plants in the province resulting in closures at various periods during the year also affected production. Nickel output was down 18.3 p.c. from the previous year's record of \$105,200,000 and copper declined 15.4 p.c. in value to \$235,500,000. Metallics in 1968 represented 83 p.c. of the total value of the provincial mineral output; in 1969 they represented 81 p.c. of the total.

Inco and Falconbridge, the main nickel-copper producers in Ontario, are each engaged in large-scale expansion programs that together will increase Canada's nickel production capacity from the 600,000,000 lb. a year at the beginning of 1969 to about 800,000,000 lb. a year in 1972 (see p. 694). There are many Ontario mines other than those of Inco and Falconbridge that produced copper in 1969, often as a co-product of other base metal production. The two largest were the Kidd Creek mine of Ecstall Mining Limited near Timmins and the Geco Division of Noranda Mines Limited at Manitouwadge. Six new copper mines are being developed for production by 1972.

Ontario produces by far the most mineral commodities of any of the provinces and territories and, in one sense, might be termed as having the most mature mineral economy but it is by no means even close to being fully explored and developed in either mineral resources or their maximum degree of processing or marketing. Large, important mineral deposits are being discovered each year both in long-established mining areas and at some distance from those centres, so that the future for mineral growth in the province is indeed promising.

Manitoba.—The province's value of mineral production advanced to \$245,600,000 in 1969 from \$209,600,000 in 1968. The largest gains were made by nickel, copper and zinc. Metallics output accounted for \$205,800,000 of the total.

Inco operated two nickel mines, a smelter and a refinery in the Thompson area and was developing two other mines in the same area for production in 1970. Sherritt Gordon Mines Limited operated its Lynn Lake nickel mine and continued development of its Fox Lake copper-zinc deposit scheduled for production in 1970 at 3,000 tons of ore a day. Dumbarton Mines Limited began production of 700 tons of nickel-copper ore a day at its Bird River location. Hudson Bay Mining and Smelting Co. Limited operated five mines in Manitoba (one in Saskatchewan) and processed its own and custom ores at the company's Flin Flon mill and copper-zinc smelter. The company is developing two additional mines in Manitoba for 1971 production. Exploration continued at high levels in the northern Precambrian areas of the province, particularly in the Thompson nickel area, where preliminary exploration had previously indicated favourable conditions.

Saskatchewan.—The value of mineral production in Saskatchewan declined from \$357,200,000 in 1968 to \$347,700,000 in 1969; values of uranium, copper and zinc registered the largest percentage declines of 16.8 p.c., 12.8 p.c. and 8.3 p.c., respectively. Production was slightly higher for the industrial minerals group but lower for both metallics and mineral fuels.

Eldorado Nuclear Limited, one of Canada's four remaining uranium producers, announced in May that it would reduce the milling rate at Beaverlodge to about 50 p.c. of capacity from the then operating rate of about 85 p.c. The mill rate adjustment to 900 tons a day was based on sales commitments. Exploration for uranium in the Beaverlodge area continued strong but considerably more attention was paid to the Wollaston Lake area in northern Saskatchewan where Gulf Minerals Company discovered uranium in 1968 and on which it announced preliminary results in July 1969. Copper was produced at three mines in the province, two of which also produced zinc. One of the latter—Western Nuclear Mines Limited—closed its mine in July when ore reserves were exhausted. Potash production was higher both in quantity and value but the industry continued to experience marketing problems, since an oversupply situation existed throughout the world and prices were at their lowest point in history. Canada remained the world's leading potash exporter and was second only to the Soviet Union in production.

Alberta.—Of Alberta's total value of mineral production in 1969 of \$1,193,300,000, the mineral fuels accounted for \$1,093,700,000. Crude petroleum alone contributed 61.3 p.c. of the total of all minerals, natural gas 18.3 p.c. and natural gas byproducts 10.9 p.c.

The Prudhoe Bay oil discovery and subsequent developments there and in Canada's Far North have already had a significant impact on oil development and marketing plans in Western Canada, particularly in Alberta where the mineral economy is closely linked to oil and gas production and markets. Governments and regulatory boards are making reappraisals of many development, production and marketing situations that are at present largely problematical but nevertheless must be considered in the total appraisal. Late in 1969, authorization was given for the construction by Syncrude Canada Limited of a second and larger plant (80,000 bbl. daily) for the extraction of oil at its Athabasca River oil sands site. Meanwhile much of the province's oil production capacity remains inoperative because of markets, even though reserves of both oil and gas register yearly increases.

Elemental sulphur recovered from the processing of natural gas was by far the most important non-metallic produced in 1969 and comprised \$60,716,000 of the total \$63,400,000 value of non-metallics. Production will rise with the continuing growth of the natural gas industry as markets develop but it is expected that, well into the 1970s, prices will remain at relatively low levels throughout the world as conditions of oversupply prevail. Production of structural materials continues to keep pace with the requirements of the total provincial economy, particularly those of the construction industry.

It is expected that output will rise substantially in the decade ahead from the 4,422,036 tons produced in 1969, as bituminous mines are developed to fill the steadily rising coking coal requirements of Japan, the export markets developing at other overseas locations, and the recently appearing needs of steel centres in Ontario. Subbituminous output should also increase as the need for domestic and possibly United States thermal-generated electric power rises. Subbituminous coal production in 1969 amounted to 3,188,000 tons.

British Columbia.—The value of British Columbia's mineral output in 1969 was \$422,800,000 compared with \$389,100,000 in 1968, a gain of 8.7 p.c. Copper continued to be the leading mineral in terms of value, contributing nearly 20 p.c. of the total, followed by crude petroleum with 13.7 p.c. Molybdenum experienced the largest percentage gain in value of output over 1968; it rose nearly 45 p.c. to reach \$47,100,000.

Ten companies operating mines in the province reported production of copper in 1969 and another six properties were under development for 1970-72 production. Four mines produced molybdenum, two of them as a co-product of copper. Extensive exploration for copper-molybdenum properties continued unabated and several are scheduled for large-scale production within the next two years. Cominco Ltd. operated its two lead-zinc mines and metallurgical plants in the southeastern part of British Columbia, producing refined zinc, lead and silver and recovering as byproducts other metals (antimony, bismuth, cadmium, tin and iron). Cominco also produces, using effluent stock gases and industrial minerals, several types of industrial chemicals and fertilizers.

Production of crude petroleum was 15.1 p.c. and natural gas 18.6 p.c. higher than in 1968. The quantity of coal produced increased only 6,300 tons over 1968 but its value increased nearly \$1,900,000 to reach almost \$7,110,000. Most of the coal was exported to Japan. The continuing development of extensive metallurgical coal deposits in British Columbia (and in Alberta) to meet commitments for shipments to Japan beginning in 1970 and continuing far into the future is, of course, one of the major developments of the Canadian mining scene. Their development and the building of handling and transportation facilities have wide implications for the economies of the two western provinces, for other mineral commodities, and for the total Canadian economy.

Yukon Territory and Northwest Territories.—The value of minerals produced in the Yukon Territory increased from \$21,400,000 in 1968 to \$37,700,000 in 1969, the metallics sector increasing from \$12,700,000 to nearly \$25,000,000. The large increase was the result of mill start-up by Anvil Mining Corporation Limited's 5,500-ton-a-day zinc-lead operations at Ross River with shipments to Japan beginning later in the year. Plans were already under way to increase mill capacity to 6,700 tons a day. Copper and silver production also increased appreciably in value. Asbestos fibre production from Canada's most northerly open-pit mine—Cassiar Asbestos Corporation Limited's mine at Clinton Creek—increased from almost 63,600 tons in 1968 to 88,000 tons valued at \$12,700,000 in 1969.

Mineral output in the Northwest Territories in 1969 increased only slightly to \$116,500,000 from \$115,600,000 in the previous year. Metallics production was worth \$115,400,000, most of which was accounted for by lead, zinc and byproduct production from the Pine Point mine on the south shore of Great Slave Lake. The mine and 8,000-ton-a-day mill of Pine Point Mines Limited, a subsidiary of Cominco Ltd., now operates entirely on concentrating-grade ore that averaged, in 1968, 3.75 p.c. zinc, 3.06 p.c. lead, and 4.30 oz. of silver a ton; initially, the company shipped considerable open-pit high-grade ore with no mill treatment but sales of direct-shipping ore ended in 1968 when 353,000 tons were shipped, averaging 25 p.c. zinc and 19 p.c. lead. Gold from Yellowknife area mines was valued at \$12,900,000 in 1969, down slightly from \$13,300,000 in the previous year. Exploration for oil continued near the Arctic Coast and on the Arctic islands and drilling was undertaken at several promising locations. The program is probably only the beginning of a long period of extensive exploration of promising areas that was sparked by the major oil discovery at Prudhoe Bay, Alaska, in 1967.

Subsection 1.—Metals

The metallic minerals of greatest dollar value to Canada in 1969 were, in order: copper, nickel, iron ore, zinc, lead, gold, silver, molybdenum, uranium and platinum group metals. These 10 metals, which accounted for 96 p.c. of the total value of metal production in 1969, and several other metals of importance are dealt with separately below.

Copper.—Interruptions of operations at various mines and smelters due to labour strikes caused a decline in mine output of copper in 1969 to 558,200 tons valued at \$574,193,000, a decrease of 75,100 tons and \$33,750,000 from 1968. Production of refined copper decreased to 450,650 tons from 524,950 tons in the previous year and consumption declined 12,940 tons to 240,250 tons in 1969. Exports of copper in concentrates decreased by 4,000 tons to 157,800 tons and exports of refined copper decreased by 66,600 tons to 210,000 tons.

Six smelters for the reduction of copper and nickel-copper ores and concentrates are operated in Canada. In the Sudbury district of Ontario, The International Nickel Company of Canada, Limited (Inco) operates smelters at Copper Cliff and Coniston, and Falconbridge Nickel Mines Limited produces nickel-copper matte at its Falconbridge smelter. Hudson Bay Mining and Smelting Co., Limited at Flin Flon, Man., smelts ores and concentrates from its mines in Manitoba and Saskatchewan and custom ores and concentrates from mines in these provinces. Ores and concentrates from most of the copper mines in Ontario, Quebec and Newfoundland are smelted at the Noranda smelter of Noranda Mines Limited and the Murdochville smelter of Gaspé Copper Mines Limited, both in Quebec. Electrolytic copper refineries are operated by Inco at Copper Cliff, Ont., and by Canadian Copper Refiners Limited, a subsidiary of Noranda Mines, at Montreal East, Que.

Copper production in Newfoundland in 1969 was 19,390 tons valued at \$19,944,000, from four producing mines. New Brunswick's copper output decreased to 7,062 tons valued at \$7,264,000 from 8,265 tons valued at \$7,950,000 in 1968. Production of copper in Quebec was 157,960 tons valued at \$162,476,000, a decrease of 9,642 tons from 1968 but an increase in value of \$1,245,000, accounted for by higher copper prices. More than 25 mines were in operation during 1969, the main centres of production being at or near Rouyn-Noranda, Val d'Or, Matagami, Chibougamau, Murdochville, and Stratford Centre. The Grandroy mine near Chibougamau, the Lorraine mine at Belleterre, and the Marbridge mine at Malartic were closed, while production commenced at mines owned by Delbridge Mines Limited near Noranda, Madeleine Mines Ltd. in Gaspé Provincial Park, and Renzy Mines Limited in Hainault township. Future producing mines were being developed near Stratford Centre and Val d'Or.

Copper was produced at more than 35 mines in Ontario in 1969, the main operations being the 21 nickel-copper mines of the Sudbury district, five copper-zinc and copper mines near Timmins, and three copper-zinc mines near Manitouwadge. Strikes at the Sudbury area mines of Inco and Falconbridge accounted for most of the 61,674-ton decline in Ontario's production to 228,944 tons in 1969. The value decreased by \$42,820,000 to \$235,490,000. Two new small mines were opened during the year and two were closed. Six mines are being developed for production by 1972.

Most of Manitoba's production of 37,042 tons of copper valued at \$38,101,000 came from the mines of Hudson Bay Mining and Smelting Co., Limited at Flin Flon and Snow Lake and, to a smaller extent, from the Lynn Lake nickel-copper mine of Sherritt Gordon Mines Limited. Hudson Bay operated six mines and continued development of the Anderson Lake and Dickstone mines for production in 1971. Sherritt Gordon planned to start production from its Fox Lake copper-zinc mine in 1970 at a rate of 3,000 tons of ore daily. Copper rejects from the Inco refinery at Thompson were shipped to Copper Cliff, Ont., for refining.

Copper production in Saskatchewan was from the mine of Anglo-Rouyn Mines Limited near La Ronge, that of Western Nuclear Mines, Ltd. at Hanson Lake, and from Hudson Bay's Flexar mine and that portion of the Flin Flon orebody that lies on the Saskatchewan

side of the provincial boundary. Production in 1969 was 18,011 tons, 4,070 tons less than in 1968; the value was \$18,525,000 or \$2,716,000 less. Western Nuclear closed its Hanson Lake mine in 1969 but continued exploration of other properties in the area.

Production of copper in British Columbia increased by 1 p.c. in 1969 to 81,344 tons valued at \$83,670,000. No new properties started production in 1969 but Brenda Mines Limited, near Peachland, Granduc Mines, Limited, near Stewart, and Churchill Copper Corporation Ltd., near Magnum Creek, planned to start operations in 1970 at rates of 24,000, 7,000 and 750 tons a day, respectively. Utah Construction & Mining Co. plans to start a 33,000-ton-a-day operation on Vancouver Island late in 1971. Lornex Mining Corporation Ltd. and Valley Copper Mines Limited were negotiating for long-term sales contracts for their huge Highland Valley deposits.

Production of copper in the Yukon Territory, all by New Imperial Mines Ltd. at Whitehorse, increased by 2,560 tons in 1969 to 7,859 tons valued at \$8,084,000. Copper produced in the Northwest Territories is obtained as a byproduct of mining high-grade silver ores.

Nickel.—Canadian production of nickel in 1969 amounted to 213,325 tons valued at \$482,400,000, a 19-p.c. decrease in quantity and a 9-p.c. decrease in value from 1968. Strikes at the Sudbury-area mines of Inco and Falconbridge accounted for the decline. Canada's position as the world's leading producer (58 p.c. of the non-communist world's nickel in 1969) remained intact but Canada's proportion will decline in the mid-1970s as new deposits are opened in New Caledonia, Australia, the Philippines, the Dominican Republic, Guatemala, Venezuela and Colombia.

In Ontario, where 69 p.c. of Canada's nickel was produced, Inco operated 10 underground mines, two open-pit mines, four mills, two smelters, a copper refinery and an iron ore recovery plant in the Sudbury area, and a nickel refinery at Port Colborne. The

company continued development of four new mines in the Sudbury area and explored and carried out development on an orebody near Shebandowan. Falconbridge operated eight mines, four mills and a smelter, and continued the development of one new mine. At Werner Lake in northwestern Ontario, Consolidated Canadian Faraday Limited (of which Metal Mines Limited, the former operator at Werner Lake, is now a part) continued production at about 600 tons of ore a day and sold a bulk nickel-copper concentrate to Inco.

In Manitoba, where over 30 p.c. of Canada's nickel was produced, Inco operated an integrated nickel mining-concentrating-smelting-refining facility at Thompson and continued development of two new mines (see p. 687). Sherritt Gordon Mines Limited at Lynn Lake produced nickel concentrates for shipment to the company's chemical refinery at Fort Saskatchewan, Alta. Supplementary feed for the refinery was obtained by importing nickel-sulphide concentrates from Australia and New Caledonia. Dumbarton Mines Limited at Bird River started production, trucking ore to the Faraday mill. Falconbridge continued development of the Manibridge mine at Wabowden with production planned for 1971.

Only one mine produced nickel in Quebec in 1969—the Renzy Mines Limited in Hainault township which started an open-pit operation. In British Columbia, Giant Mascot Mines Limited, near Hope, produced a bulk nickel-copper concentrate for export to Japan.

¹ Includes 15 tons of producers' shipments in Saskatchewan.

² Includes 162 tons of producers' shipments in Saskatchewan.

³ Includes 144 tons of producers' shipments in Saskatchewan.

Iron Ore.*—Iron ore shipments amounted to 35,715,000 tons valued at \$431,930,000 in 1969, compared with shipments of 42,360,000 tons valued at \$532,694,000 in 1968. Both exports, at 27,900,000 tons, and domestic shipments, at 7,800,000 tons, were down sharply from 1968. The inability to produce and deliver as a result of widespread iron ore industry strikes was mainly responsible for the losses. Strikes at Canada's two largest integrated steelworks resulted in a production loss of about 1,300,000 short tons. Some of this tonnage was made up in the last few months of the year but total steel production at 10,307,000 short tons was 944,000 short tons lower than in 1968. Domestic consumption of iron ore at iron and steel plants was 9,303,000 tons, of which some 7,400,000 tons came from Canadian mines and about 1,900,000 tons from outside the country. Total receipts at iron and steel plants, comprising 7,461,000 tons of domestic iron ore and 2,260,000 tons of imported iron ore, exceeded consumption by 400,000 tons, and iron ore stocks at the plants went up accordingly.

The Canadian iron ore industry began a period of slow growth in 1969; no new capacity was added, only 420,000 tons is likely to be added in 1970, and none is expected in 1971. The anticipated 1970 increase will include a 300,000-ton-a-year reduced iron ore plant at

* Quantities of iron ore given in this Section are in long tons of 2,240 lb.

Falconbridge and a 120,000-ton expansion of the Sherman mine at Temagami. Inco's expansion of 250,000 tons has been deferred to 1972. Zeballos Iron Mines Limited in British Columbia was closed in 1969.

Production in 1969 came from mines of 17 companies of which eight had mines in Ontario, five in British Columbia, two in Quebec and two in Newfoundland (Labrador). One of the latter also had mines in Quebec-Labrador.

Newfoundland and Quebec were the most seriously affected by the labour strike, shipments from Newfoundland being down from 17,600,000 tons in 1968 to 13,200,000 tons, and those from Quebec by 1,700,000 tons to 11,500,000 tons. Iron Ore Company of Canada, with direct-shipping ore from deposits on both sides of the Labrador-Quebec border at Schefferville and concentrating-grade deposits near Labrador City, is the largest shipper of iron ore in Canada, accounting for 35 p.c. of 1969 shipments. Other shippers were Quebec Cartier Mining Company and Hilton Mines Ltd., both in Quebec, and Wabush mine in Labrador.

Ontario shipments, at 9,300,000 tons, were down only slightly from 1968 despite labour strikes at four mines—Algoma Ore Division of The Algoma Steel Corporation, Limited; Caland Ore Company Limited; and Falconbridge and Inco, both byproduct producers. Decreased shipments from these mines were largely offset by increased shipments from two of Ontario's new pellet producers—Steep Rock Iron Mines Limited and the Sherman mine—both of which operated at about rated capacity for the first time. The Griffith mine, which also increased shipments, is not expected to attain rated production until 1970. Another stabilizing factor was capacity production at the other Ontario mines—Adams mine of Jones & Laughlin Mining Co.; Moose Mountain mine of National Steel Corporation of Canada Limited; and Marmoraton Mining Company, Ltd.

British Columbia shipments, at 1,700,000 tons, were down slightly from the 1968 total of 1,900,000 tons. Shipments increased from Wesfrob Mines Limited, Texada Mines Ltd., and Coast Copper Company Limited but decreased from Zeballos Iron Mines Limited which was closed in mid-year, and from Brynnor Mines Limited which continued to ship from stockpile but at a reduced rate. All British Columbia shipments were consigned to Japan.

Exports of iron ore fell from a record 36,000,000 tons in 1968 to 27,900,000 tons in 1969, the weakness being caused, of course, by inability to produce and deliver iron ore because of the strikes that took place during the spring and summer when operations reach their highest production rates. Exports to the United States, Britain, Italy, West Germany, and Belgium and Luxembourg were all lower than in 1968, although those to the Netherlands and Finland were higher. Exports to the United States, at 18,200,000 tons, accounted for 65 p.c. of total shipments, and those to Britain were 2,900,000 tons, or 10 p.c. Japan and the Netherlands each took 2,200,000 tons, West Germany 1,200,000 tons, and Italy 1,000,000 tons. Small tonnages went to Belgium and Luxembourg, Finland, France and the Bahamas. The trend toward lower imports continued in 1969 as they declined 400,000 tons from 1968 to 2,300,000 tons. Of the total imports, the United States provided 2,000,000 tons, or 87 p.c., followed by Brazil with 200,000 tons. Chile, Venezuela and Mauritania shipped small tonnages to Canada; Mauritania was a supplier for the first time.

Lead and Zinc.—Production of lead in 1969 was almost 7 p.c. less than the record high of 340,200 tons in 1968, and equivalent to 12 p.c. of the non-communist world total. Primary refined lead production of 187,100 tons was derived from two plants, one operated by Cominco Ltd. at Trail, B.C., where annual capacity is 190,000 tons, and the other operated by East Coast Smelting and Chemical Company Limited, a subsidiary of Brunswick Mining and Smelting Corporation Limited, at Belledune, N.B., where capacity is 33,000 tons annually. Exports of lead in ores and concentrates totalled 140,200 tons of contained lead, compared with 143,900 tons in 1968, and went mainly to the United States, Japan, West Germany and Belgium. Exports of refined lead amounted to 107,090 tons, 23 p.c. less than

in 1968, and went mainly to the United States and Britain. The lead price, f.o.b. Toronto and Montreal, increased from 13.5 cents a pound at the beginning of 1969 to 16.5 cents in mid-December.

Zinc production rose in 1969 to a new record of 1,196,291 tons, 3.2 p.c. more than in 1968 and equivalent to 25 p.c. of the non-communist world total. Canada has been the world's largest mine producer since 1964. Refined zinc output rose from 426,700 tons in 1968 to 466,400 tons in 1969 in response to good demand and rising zinc prices, although production was still below capacity at three of Canada's four primary zinc plants; output at the fourth plant was slightly above rated capacity. Exports of zinc in ores and concentrates, totalling 804,700 tons, went mainly to the United States, Belgium, West Germany and Japan. Refined exports amounted to 307,400 tons and went mainly to the United States and Britain. The domestic producers' price of zinc rose by two cents a pound between January and September and remained at 15.5 cents a pound for the remainder of the year.

Production of lead and zinc in the Northwest Territories, amounting to 102,500 and 220,000 tons, respectively, came from Pine Point Mines Limited. Pine Point ceased production of direct-shipping ore in December 1968 and in January 1969 its nearby Sphinx mine and 3,000-ton-a-day mill addition began operations. In the Yukon Territory, Anvil Mining Corporation Limited began tune-up operations, in September 1969, at the 5,000-ton-a-day concentrator at its zinc-lead-silver property near Ross River. An increase in the mill capacity of 6,600 tons daily was scheduled for early 1970.

Lead and zinc production in British Columbia was mainly from Cominco's Sullivan mine and 10,000-ton concentrator at Kimberley. The company also operated the Bluebell mine and 700-ton mill in the Slocan district. Among other lead-zinc producers were Western Mines Limited at Buttle Lake on Vancouver Island, and Canadian Exploration, Limited and Reeves MacDonald Mines Limited in southeastern British Columbia. Anaconda Britannia Mines Ltd. produced copper and zinc concentrates at Britannia Beach.

Hudson Bay Mining and Smelting Co., Limited recovered lead and zinc from base-metal ores of three mines at or near Flin Flon on the Saskatchewan-Manitoba border and three mines near Snow Lake, Man. Its Flexar copper-zinc mine southwest of Flin Flon began operations in April 1969, and two new mines were under development in the Snow Lake area. Sherritt Gordon Mines, Limited planned to bring its Fox copper-zinc mine and mill, 28 miles southwest of Lynn Lake, Man., into production in mid-1970 at 3,000 tons a day.

In Ontario, Eestall Mining Limited operated a zinc-copper-lead mine and 9,000-ton-a-day mill near Timmins and remained Canada's largest mine producer of zinc as well as Ontario's leading producer of lead. Eestall, a subsidiary of Texas Gulf Sulphur Company, is constructing, near Timmins, two plants which will initially produce about 120,000 tons of slab zinc metal and 230,000 tons of sulphuric acid annually. Other Timmins-district mine producers were Kam-Kotia Mines Limited and Canadian Jamieson Mines Limited, which operated copper-zinc mines and mills, and Jameland Mines Limited which, in November 1969, began mining zinc-copper ore for custom treatment at a nearby mill. The remainder of Ontario's lead and zinc output came principally from copper-zinc-lead mines at Manitouwadge operated by Noranda Mines Limited (Geco Division), Willecho Mines Limited and Wilroy Mines Limited. Selco Exploration Company Limited planned to bring into production by 1971 its copper-zinc property in the Uchi Lake area of north-western Ontario. Late in 1969, Mattagami Lake Mines Limited discovered a substantial zinc-copper-silver-lead deposit on the south side of Sturgeon Lake in Ontario and planned to bring the property into production in 1972.

In Quebec, relatively small amounts of lead, as well as some zinc, were produced by the Cupra and Solbec Divisions of Sullivan Mining Group Ltd. in the Eastern Townships.

Six mining companies associated with Noranda Mines Limited accounted for about 85 p.c. of zinc output in Quebec, most of the remainder coming from three mines—near Noranda, Val d'Or and Matagami—which operated copper-zinc mines. Late in 1969, Delbridge Mines Limited brought a zinc-copper mine in the Noranda area into production and D'Estric Mining Company Ltd. was considering bringing into production in 1970 a copper-zinc-lead property adjacent to the Cupra mine.

In New Brunswick, the largest lead-zinc producer was Brunswick Mining and Smelting Corporation Limited, which operated mines and concentrators in the Bathurst district. Other producers were Heath Steele Mines Limited, which almost doubled capacity to 1,000,000 tons of zinc-copper-lead ores annually at its Newcastle area property, and Nigadoo River Mines Limited which operated a 1,000-ton lead-zinc-copper mill in the Bathurst district. The Anaconda Company (Canada) Ltd. and Cominco Ltd. announced that their jointly owned Caribou zinc-lead-copper property, about 30 miles northwest of Bathurst, would be brought into production. A 1,000-ton-a-day concentrator, to treat a relatively small deposit of copper ore, was under construction with production scheduled for 1970. A second ore zone contains a much larger tonnage of lead-zinc-silver sulphides, and the feasibility of bringing it into production was under investigation. In Newfoundland, both lead and zinc concentrates were produced at the zinc-lead-copper mine of the American Smelting and Refining Company at Buchans.

Canada's mine production of lead and zinc in 1970 is forecast to be about 19 p.c. and 7 p.c., respectively, higher than 1969.

Gold.—Canadian gold production in 1969 amounted to 2,502,169 oz. t. valued at \$94,331,773, a decline of 8.8 p.c. from 1968. The average price for gold paid by the Royal Canadian Mint in 1969 was \$37.69 per oz. t. (Cdn.), down from \$37.71 in the previous year. From 1962 through 1969, the range in value for the Canadian dollar was \$0.916 to \$0.934 in relation to the United States dollar and the corresponding Royal Canadian Mint gold price between \$37.46 and \$38.22 per oz. t. Canadian lode and placer gold mines continued to experience serious economic difficulties with costs of recovery maintaining an upward trend. Of the 34 lode gold mines operating in Canada in 1969 there was only one that did not receive assistance under the terms of the Emergency Gold Mining Assistance Act (see p. 722). Three of the 34 lode gold mines closed in 1969.

Gold produced from lode gold mines, from base metal ores and from placer mines dropped 8.2 p.c., 11.1 p.c. and 17.0 p.c., respectively, below 1968 levels. The proportion of gold derived from lode gold mines was 81.0 p.c. of the total output, from base metal mines 18.7 p.c. and from placer mines 0.3 p.c. compared with 80.5 p.c., 19.2 p.c. and 0.3 p.c. in 1968. Ontario remained the principal producing province, accounting for 48.2 p.c. of the total compared with 50.3 p.c. in 1968; Quebec, the Northwest Territories and British Columbia accounted for 29.5 p.c., 13.7 p.c. and 4.5 p.c., respectively, compared with 28.0 p.c., 12.8 p.c. and 4.5 p.c. in 1968.

In Ontario, production declined 12.6 p.c. to 1,206,110 oz. t. from 1,379,779 oz. t. in 1968; 17 lode gold mines operated during the year compared with 20 in 1968. Gold recovered as a byproduct from base metal ores was 4.7 p.c. of the provincial total. Quebec production declined by 4.0 p.c. to 737,554 oz. t. from 768,068 in 1968; lode gold output was 4.5 p.c. lower. Ten gold mines operated in the province in 1969; two were closed. Gold recovered as a byproduct from base metal ores represented 34.2 p.c. of the provincial total compared with 33.8 p.c. in 1968.

In the Northwest Territories, production declined by 2.6 p.c. to 343,116 oz. t. from 352,306 oz. t. in 1968. Discovery Mines Limited, north of Yellowknife, closed in 1969. Production is all from lode gold mines. British Columbia production amounted to

112,821 oz. t. compared with 124,422 oz. t. in 1968. A minor amount of gold was produced from placer deposits. Gold recovered as a byproduct from base metal ores represented 59.8 p.c. of the provincial total compared with 57.5 p.c. in 1968. Combined production from Manitoba and Saskatchewan amounted to 67,143 oz. t. compared with 84,125 oz. t. in 1968. All gold recovered in 1969 was a byproduct of base metal production. In the Yukon Territory, production increased from 24,167 oz. t. in 1968 to 26,305 oz. t. in 1969. Arctic Gold and Silver Mines Limited contributed to production in 1969 but the mine closed in the latter part of the year. Placer deposits accounted for 7,940 oz. t. of the gold produced. In Newfoundland and New Brunswick, all gold was recovered as a byproduct of base metal production.

Silver.—Canada's mine production of silver in 1969, at 43,093,000 oz. t., was about 2,000,000 oz. t. lower than the all-time high of 1968. The decrease was due mainly to lower byproduct output at several base metal mines in British Columbia, and at the silver-copper property of Echo Bay Mines Ltd. near Port Radium in the Northwest Territories. Although its output of 22,033,000 oz. t. was only slightly higher than in 1968, Ontario was again the leading silver-producing province, primarily because of the substantial byproduct silver produced at the Kidd Creek base metal mine of Ecstall Mining Limited near Timmins. Base metal ores continued to be the main source of Canadian output, accounting for almost 90 p.c. of total mine production. Close to 10 p.c. came from silver-cobalt ores mined in northern Ontario and the remainder was byproduct recovery from lode and placer gold ores.

Canadian production was valued at \$83,169,443 in 1969. The \$20,945,156 reduction from 1968 resulted partly from decreased output but more particularly from lower silver prices. The price of silver in Canada fluctuated in 1969 between a high of \$2.178 an oz. t. and a low of \$1.670. Reported consumption of silver in 1969 was 5,747,068 oz. t., some 7,851,290 oz. t. less than in 1968. The reduction was almost entirely accounted for by the fact that no silver was used in the production of Canadian coinage; in the second half of 1968, the Royal Canadian Mint changed over to pure nickel from silver alloy in the Canadian dollar, 50-cent, 25-cent and 10-cent coins.

The silver refinery of Kam-Kotia Mines Limited, Refinery Division, at Cobalt, Ont., was Canada's largest producer of refined silver. It recovered a total of 19,971,000 oz. t. in the processing of silver-cobalt ores and concentrates and in the toll refining of silver bullion and coins imported from the United States. Canadian Copper Refiners Limited, at Montreal East, Que., was the second largest producer, recovering 12,360,000 oz. t. in refining anode and blister copper. Other producers of refined silver were Cominco at Trail, B.C., (from lead and zinc ores and concentrates); Inco at Copper Cliff, Ont., (from nickel-copper concentrates); and the Royal Canadian Mint at Ottawa, Ont., (from gold bullion). At Belledune, N.B., East Coast Smelting and Chemical Company Limited recovered byproduct silver from lead-zinc concentrates treated in an Imperial Smelting Process blast furnace.

The three largest primary sources of silver in Canada in 1969 were the Kidd Creek zinc-copper-silver mine near Timmins, Ont., operated by Ecstall, the Sullivan lead-zinc-silver mine at Kimberley, B.C., operated by Cominco, and the silver-lead-zinc mines in the Yukon Territory, about 200 miles north of Whitehorse, operated by United Keno Hill Mines. Expressed as the silver content of concentrates produced, Ecstall recovered 13,822,000 oz. t., Cominco 3,039,430 oz. t., and United Keno 2,405,615 oz. t. Other important mine producers of byproduct silver, in declining order of output, included: Echo Bay Mines Ltd. near Port Radium, N.W.T.; Noranda Mines Limited (Geco Division) at Manitouwadge, Ont.; Brunswick Mining and Smelting Corporation Limited near Bathurst, N.B.; American Smelting and Refining Company (Buchans Unit) in Newfoundland; and Inco at Copper Cliff, Ont.

Some 4,165,500 oz. t. of silver were derived from silver-cobalt ores mined in the Cobalt-Gowganda area of northern Ontario; the largest producer was again Silverfields Mining Corporation Limited with an output of 1,143,018 oz. t.

¹ Includes relatively small quantities produced in Alberta.

Uranium.—Although the long-term outlook for the Canadian uranium industry remained bright in 1969, continued efforts on the part of uranium producers to negotiate additional long-term sales met with very limited success. Moreover, it became apparent that present producers were faced with difficulties over the next two or three years due to a decline in near-term demand, a situation that resulted primarily from delays in nuclear plant construction, improvements in reactor and fuel design, and the consequent build-up of inventories by reactor manufacturers and utilities. The situation was further aggravated by the continued restriction on United States uranium imports and by increased competition in overseas markets.

Also of concern to Canadian producers was the possible United States Atomic Energy Commission's (USAEC) disposal procedure for its surplus uranium stocks and the proposed removal of the restriction on enrichment of foreign uranium in USAEC enrichment plants, announcements of which were expected to be made in 1970. However, at the end of 1969 the possibility of negotiations developing between the United States and Canada concerning the future exchange of other energy fuels had clouded the outcome of these issues.

Canadian uranium production in 1969 continued to come from the Elliot Lake area in Ontario and the Uranium City area in northern Saskatchewan, production being shared 80 p.c. and 20 p.c., respectively. At Elliot Lake, Denison Mines Limited operated at approximately two-thirds capacity and Stanrock Uranium Mines Limited continued to produce limited quantities of uranium through its leaching process. The Quirke mill, operated by Rio Algom Mines Limited, was the only production operation to work at capacity in 1969. At Uranium City, Eldorado Nuclear Limited was operating at about 50-p.c. capacity at year-end. Production from all four operations totalled 4,450 tons of uranium oxide (U_3O_8) of which only 3,855 tons valued at \$49,665,506 were shipped.

Sales of uranium made in 1969 were limited to three small contracts; Eldorado and Rio Algom each reported a small contract with a Japanese utility and Rio Algom also contracted the sale of 55,500 lb. of U_3O_8 to fuel the first Japanese nuclear ship. Of some encouragement, however, was Denison's confirmation, in early 1970, of an extension to its 1967 long-term contract with the Tokyo Electric Power Co. calling for an additional 16,750 tons of U_3O_8 over a ten-year period commencing in 1974. In June 1969, Canada reaffirmed its policy of supplying uranium for peaceful purposes only.

Despite the poor short-term demand, developments among Canadian producers continued to reflect faith in the future of the uranium industry. In 1969, Denison continued to make changes in equipment and mining methods aimed at increasing the efficiency of its underground operations; Rio Algom completed a series of tests preparatory to increasing significantly the capacity of its Quirke mill; Eldorado prepared to sink a new internal production shaft to develop downward extensions of its Fay orebody; development continued on Agnew Lake Mines Limited's deposit, 30 miles west of Sudbury, Ont.; and, finally, Eldorado reached a record production figure in the refining of ceramic UO_2 powder and prepared to begin production of UF_6 in mid-1970, thus putting Canada in a position to supply a full range of refined uranium products.

The tempo of uranium exploration remained high in 1969 and several new areas of interest were identified. Ontario's Elliot Lake and Agnew Lake areas were again the scenes of a major portion of the drilling activity in 1969. Activity was also of interest in the Lac Forestier-Sté Anne du Lac and Grindstone Lake areas in Quebec and the Kaipokok Bay and Michelin-McLean Lake areas of Labrador. Perhaps the most significant activity, however, was in northern Saskatchewan where a uranium discovery, made by Gulf Minerals Company in late 1968, precipitated a land acquisition rush early in 1969 involving dozens of companies and millions of acres of mineral rights. By year-end, Gulf had completed 60,000 feet of drilling and had indicated that the deposit would likely be developed to satisfy internal demands for uranium from Gulf General Atomic Inc. Despite the heavy exploration activity in 1969, a decline was predicted for 1970 due largely to the temporary lull in the uranium market.

The uranium industry can look forward to a growing market for its product beginning in the mid-1970s. Although, at present, there is a large surplus of production capability in the non-communist world, projected requirements exceed present capability after 1975, and reach an estimated 72,000 tons of U_3O_8 a year by 1980. This will require a threefold increase in production, much of which will come from yet undiscovered deposits. Canada, with only 20 p.c. of its known, low-cost, reasonably assured reserves committed, and significant additional potential, is in a good position to share in this growing world market.

15.—Quantity and Value of Producers' Shipments of Uranium (U_3O_8), by Province, 1960-69

Molybdenum.—Production of molybdenum in Canada in 1969 was 30,300,000 lb. valued at \$52,600,000 compared with 22,500,000 lb. valued at \$37,300,000 in 1968. Canada was second only to the United States among world producers of molybdenum and supplied approximately 21 p.c. of the estimated non-communist world production of 142,100,000 lb. About 90 p.c. of the Canadian production came from British Columbia and the remainder from Quebec.

Brenda Mines Ltd., under Noranda Mines Limited management, started initial operations in December 1969 on its copper-molybdenum property some 24 miles west of Kelowna, B.C. The new crushing and concentrating plant is equipped to handle 24,000 tons of open-pit ore a day. The orebody is estimated at 177,000,000 tons averaging 0.183 p.c. copper and 0.049 p.c. molybdenum. British Columbia Molybdenum Limited completed a second full year of operation at its 6,000-ton-a-day mine and concentrator near Alice Arm, and produced 5,567,700 lb. of molybdenite (MoS_2) concentrates. Boss Mountain Division of Brynnor Mines Limited in the Cariboo District of central British Columbia produced 2,342,000 lb.; ore extraction was 547,500 tons averaging 0.23 p.c. molybdenum and recovery was 92.7 p.c.

Endako Mines Ltd. produced 12,962,224 lb. of molybdenite (MoS_2) concentrates and 5,842,495 lb. of the roasted product, molybdic oxide (MoO_3). Average grade of ore milled was 0.189 p.c. molybdenite concentrates and recovery was 85.96 p.c. Concentrator throughput was 26,600 tons a day and an average of 35,400 tons of ore and waste were mined per operating day. A new larger roaster was operating at an annual capacity of 9,000,000 lb. of contained molybdenum at the end of 1969. Briquette production at a plant rate of 1,200 lb. an hour was expected to start in mid-1970. Proven and probable ore reserves at the end of the year were 214,000,000 tons averaging 0.146 p.c. MoS_2 . Red Mountain Mines Limited, near Rossland in south-central British Columbia, produced 738,810 lb. of molybdenite concentrates in 1969.

Lornex Mining Corporation Ltd., managed by Rio Algom Mines Limited, proceeded with construction and development, for late 1971 production, of a large copper-molybdenum

property some 33 miles south of Ashcroft in the Highland Valley of British Columbia. The orebody is estimated to contain 293,000,000 tons averaging 0.427 p.c. copper and 0.014 p.c. molybdenum, and annual production is expected to be about 54,000 tons of copper and 2,500,000 lb. of molybdenum. Utah Construction & Mining Co. began preparing, for production in late 1971, a 33,000-ton-a-day copper-molybdenum mining and milling project in the northern part of Vancouver Island. Ore reserves there are estimated at 280,000,000 tons averaging 0.52 p.c. copper and 0.029 p.c. molybdenum, and annual output is expected to be about 53,000 tons of copper and 1,900,000 lb. of molybdenum. Highmont Mining Corp. Ltd. proceeded with development and testing on its 34-claim copper-molybdenum property in the Highland Valley adjoining and east of Lornex. In addition, there were a number of other molybdenum and copper-molybdenum properties in British Columbia being explored and studied for production possibilities.

Molybdenum producers in Quebec produced nearly 3,000,000 lb. in 1969. They were: Molybdenite Corporation of Canada Limited at Lacorne; Preissac Molybdenite Mines Limited and Cadillac Moly Mines in the Lake Preissac area near Val d'Or; and Gaspé Copper Mines, Limited, which produces byproduct molybdenum from its copper operations at Murdochville. Beattie-Duquesne Mines Limited converted molybdenite concentrates from various producers to molybdc oxide at a roasting plant at Duparquet, and Masterloy Products Limited produced ferro-molybdenum at its ferro-alloy plant near Ottawa, Ont.

Platinum Metals.—Production of the platinum metals in 1969, which amounted to 266,100 oz.t. valued at \$26,449,000, was 219,791 oz.t. and \$19,750,000 lower than in 1968 as a result of decreased nickel production. Canadian nickel ores contain about 0.025 oz.t. of platinum metals a ton. When nickel matte is electrolytically refined, the platinoids—platinum, palladium, rhodium, ruthenium, iridium and osmium—are precipitated in the electrolytic tanks as a sludge. The sludge is purified and sent to refineries in Britain and the United States for recovery of the platinum metals.

Half of the world's output of platinum metals is from the Soviet Union and most of the remainder is produced in Canada and the Republic of South Africa. World demand remained strong in 1969 and consumption in the non-communist countries exceeded mine production. The deficit was made up by purchases from the Soviet Union.

Cadmium.—Cadmium output in 1969, expressed as the sum of refined metal and the recoverable cadmium content of exported zinc concentrates, was 4,368,405 lb. valued at \$15,010,000; corresponding figures for 1968 were 5,014,965 lb. and \$14,292,000. The decrease of nearly 13 p.c. in the volume of output was due to the treatment of lower grade ores. Cadmium is recovered as a byproduct during the smelting and refining of zinc ores and concentrates. Most of the zinc ores in Canada carry minor quantities of the metal, being in the order of $\frac{1}{2}$ lb. of cadmium in each ton of ore on average, but varying from none to $1\frac{1}{2}$ lb. The largest production comes from the Kidd Creek mine near Timmins, Ont., followed by Pine Point Mines Limited in the Northwest Territories, Cominco in British Columbia, Hudson Bay Mining and Smelting in Saskatchewan and Manitoba, and the Noranda group of companies in Ontario, Quebec and New Brunswick. Refined cadmium is produced at the electrolytic zinc plants of Cominco at Trail, B.C., Hudson Bay Mining and Smelting at Flin Flon, Man., and Canadian Electrolytic Zinc Limited at Valleyfield, Que. East Coast Smelting and Chemical Company Limited at Belledune, N.B., which started zinc-lead smelting and byproduct recovery of cadmium in 1967, recovers cadmium as a zinc-cadmium sponge which is refined at Valleyfield.

Cobalt.—Canadian cobalt production in 1969 was 3,200,000 lb. valued at \$6,900,000 compared with 4,030,000 lb. valued at \$8,700,000 in 1968. Production was reduced by strikes at the Sudbury, Ont., operation of Inco, which lasted from July 10 to Nov. 17, and at Falconbridge operations at Sudbury from Aug. 21 to Nov. 23. Currently one of the five major cobalt producing countries, Canada obtains nearly 90 p.c. of its cobalt as a byproduct of nickel-copper ores with the remainder, also a byproduct, from silver-cobalt ores.

Magnesium.—Dominion Magnesium Limited, with mine and smelter at Haley Station, Ont., is the only producer in Canada; smelting capacity is 12,000 tons annually. Production increased to 10,485 tons in 1969 valued at \$7,094,000 from 9,929 tons valued at \$6,182,000 in 1968 and exports of primary magnesium increased to \$4,726,000 from \$4,261,000. Imports of magnesium metal and alloys totalled \$2,650,000. Canadian consumption in 1968 was 5,654 tons, including 1,699 tons of imported metal. World production, excluding communist countries, was estimated at 216,100 tons in 1969.

Selenium and Tellurium.—Selenium production in 1969 was 710,618 lb. valued at \$4,375,563, and was 11.8 p.c. higher than in 1968. Tellurium output was 103,777 lb. valued at \$671,588, 46.2 p.c. higher. These metals are recovered from the anode muds resulting from electrolytic refining of copper anodes at the plants of Canadian Copper Refiners Limited at Montreal East, Que., and Inco at Copper Cliff, Ont.

Columbium (Niobium) and Tantalum.—St. Lawrence Columbium and Metals Corporation produced 3,059,052 lb. of columbium pentoxide (Cb_2O_5) in the year ended Sept. 30, 1969, compared with 2,005,989 lb. in the corresponding period ended in 1968. Production during the 1969 calendar year was 3,495,440 lb. St. Lawrence Columbium is the only Canadian producer of columbium and operates one of only two mines in the world that produce columbium in pyrochlore concentrates as a primary product; the other, larger operation is near Araxa, Brazil. The demand for columbium continued to increase in 1969 and St. Lawrence planned to produce 4,500,000 lb. in 1970. Published spot prices for Canadian pyrochlore concentrates, f.o.b. mine site, after declining to 90–93 cents (U.S.) a pound of contained Cb_2O_5 in April 1968 and recovering to 92–98 cents (U.S.) in December 1968, increased to \$1.00–\$1.05 (U.S.) in the latter part of 1969.

Canada's first commercial production of tantalum began in 1969 at the Bernic Lake, Man., mine of Tantalum Mining Corporation of Canada Limited. Annual production was expected to be 500,000, or more, pounds of tantalum pentoxide (Ta_2O_5) with the new plant operating at its rated capacity of 500 tons of ore a day. Concentrates were shipped in the second half of 1969 and in September the company announced a price of \$7 (U.S.) a pound of Ta_2O_5 in 50 p.c. concentrates, f.o.b. mine site, for the remainder of the sales contracted for delivery to the end of 1970.

Subsection 2.—Industrial Minerals

The value of industrial minerals produced in 1969, at \$908,295,000, was about 2 p.c. higher than in the previous year. A pronounced drop in the value of shipments of elemental sulphur was offset by increases in structural materials and in most other non-metallic minerals. Developments in a number of industrial minerals during 1969 are reviewed below.

Asbestos.—Asbestos production in 1969 at 1,596,450 tons was only 499 tons more than in 1968 but the value of production rose about 6 p.c. to \$196,759,000. Quebec accounts for about 84 p.c. of Canada's total asbestos output and Newfoundland, Ontario, British Columbia and the Yukon Territory for the remainder. Most of the Canadian production is exported as milled fibre and shorts, providing about 70 to 75 p.c. of world exports and 35 p.c. of world production. The principal markets for Canadian fibre include the United States, West Germany, Britain and Japan.

The world outlook for asbestos consumption is favourable. A 4-p.c.-a-year increase in use is forecast and Canadian companies have been modernizing and expanding production facilities to ensure their share of that increase. In Quebec, Canadian Johns-Manville Company, the largest company with the largest mine, continued mill expansion that should lead to an increase in production of 100,000 tons of fibre a year; at Thetford Mines, Asbestos Corporation Limited continued development of the Penhale deposit adjacent to the Normandie mine and announced plans to put its Asbestos Hill deposit in the Ungava district

of Quebec into production by 1972; and Bell Asbestos Mines, Ltd., proceeded with its new shaft at Thetford Mines. One producer, Nicolet Asbestos Mines Ltd., closed at the end of January 1969 because of exhaustion of ore reserves. McAdam Mining Corporation Limited at Chibougamau and Abitibi Asbestos Mining Company Limited north of Amos continued exploration and diamond drilling of their respective properties.

In British Columbia, Cassiar Asbestos Corporation Limited continued expansion of its mill from 75,000 to 110,000 tons of fibre a year, to be ready by 1970. The company continued production at Clinton Creek mine in the Yukon Territory and was adding mill equipment there to increase output to 100,000 tons of fibre a year. Newfoundland's sole producer, Advocate Mines Limited, had lower output in 1969 because of a strike that lasted from May 22 to July 31. Ontario's asbestos production should increase in 1970 with a full year's production from the Reeves mine of Johns-Manville Mining and Trading Limited and from the Matheson mine of Hedman Mines Limited.

Potash.—Potash mining is a comparatively new development in Canada, the entire industry being centred in Saskatchewan. Significant production began in 1962 with a value of \$3,000,000 and development of the industry mushroomed to the extent that, in 1969, Canada became the world's leading producer with an output valued at \$67,120,000. About 95 p.c. of the world's potash output is for fertilizers; Canada's potash consumption is barely 8 p.c. of its output so that most of it must be exported. From 1967 to 1969, the United States took about two thirds of Canada's potash exports, the remainder going to overseas markets, chiefly Japan and Britain.

At the end of 1969, nine mines—eight using conventional mining methods and one employing solution methods—with an installed annual productive capacity of 12,000,000 tons of potash product (potassium chloride) were operating in Saskatchewan and a tenth mine was under construction for completion in 1971. The rapid growth of this industry has been accompanied by serious marketing problems. For example, in 1969, the industry operated well below its productive capability, with output amounting to 6,100,000 tons of potassium chloride and sales totalling 5,700,000 tons. The marketing difficulties, involving oversupply, low prices and some uncertainty as to whether Canadian producers would have free access to the United States market, prompted the Province of Saskatchewan to promulgate the Potash Conservation Regulations, effective Jan. 1, 1970, whereby it controls potash production and influences marketing.

Salt.—Salt production in Canada in 1969 was 4,247,000 tons, about three fourths of which was mined rock salt used primarily for snow and ice control on streets and highways and for chemical manufacture, and the remainder fine vacuum salt and salt as brine for use in producing caustic soda and chlorine. There are three rock salt mines, one in Nova Scotia and two in southwestern Ontario; fine salt evaporator plants and brining operations are located in Nova Scotia, Ontario, Manitoba, Saskatchewan and Alberta. Most of British Columbia's salt needs are met by imports of solar salt from Mexico and the San Francisco Bay area.

Sulphur.—Canadian production of elemental sulphur in 1969 was 2,985,000 tons valued at \$62,986,000; sulphur production in all forms including sulphur recovered from smelter gases and contained in pyrites amounted to 3,646,000 tons valued at \$73,319,000. Most of the sulphur produced is extracted as elemental sulphur from sour natural gas in Western Canada. Canada is now the world's largest producer of sulphur from hydrocarbon sources and is the world's largest exporter. Exports in 1969 increased 7 p.c. over 1968 to reach a record 2,264,000 tons valued at \$62,742,000. However, reflecting a world oversupply situation and an extremely competitive marketing environment, value of export shipments decreased some 18 p.c.

For the second consecutive year, world sulphur production exceeded demand and producers' stockpiles continued to build up throughout the year. This oversupply situation may be attributed to a combination of increased output, notably in Canada and Poland, and slackening demand in the major sulphur-consuming industries, in particular the fertilizer industry which accounts for almost half of all sulphur utilized.

¹ Recovered from sour natural gas and nickel sulphide ores. zinc sulphide concentrates at Arvida and Port Maitland. to produce iron residues or sinter.

² Includes sulphur in acid made from roasting. ³ From 1961, excludes pyrite and pyrrhotite used

Gypsum.—Gypsum production in Canada was 6,872,000 tons in 1969. Operations in five of the six producing provinces increased over the previous year reflecting a favourable situation in the building construction industry in Canada and the United States. About 70 p.c. of Canada's gypsum output is exported to the United States, most of it from Nova Scotia quarries, which account for 75 p.c. of total Canadian production of crude gypsum.

During 1969, three companies signified intentions to build gypsum products plants in the Edmonton area of Alberta and construction began on one plant at Clover Bar destined for start-up in 1970. Canadian Gypsum Company, Limited increased the production capacity of its gypsum products plant at Hagersville, Ont., by doubling the output potential of one wallboard line.

Nepheline Syenite.—Nepheline syenite was first produced in 1936 and, until recently when Norway started production, remained a uniquely Canadian mineral commodity. "Nepheline syenite" is a rock name that applies to a mixture of minerals, essentially the feldspars and nepheline. The presence of nepheline provides the mixture with a higher content of alumina (Al_2O_3) than has either soda or potash feldspar and makes nepheline syenite more desirable than feldspar in certain applications, especially in the manufacture of glass, for which about 75 p.c. of the output is used. However, markets for finely ground material, used in the manufacture of whitewares, such as bathroom fixtures, china, ovenware, electrical porcelain and ceramic artware, are growing rapidly. Very finely ground material is being increasingly used as a filler material in plastics, foam rubber, and paints. Low-grade material is sold in bulk for use in the manufacture of fibreglass and for glazing on brick and tile.

Production originates from two mines in Canada, both located in Ontario on Blue Mountain, some 25 miles northeast of Peterborough. The deposit is pear-shaped, approximately five miles in length and up to one and a half miles in width. Reserves are very large. In 1969, production reached an all-time high of 502,893 tons valued at \$5,882,000, representing an increase in tonnage of 18 p.c. over the previous year. Some 80 p.c. is exported, most of it going to the United States for use in glass manufacture. In 1969, exports increased about 22 p.c. to reach 395,613 tons valued at \$5,120,000.

Structural Materials

The value of all construction undertaken in Canada in 1969 was estimated to be \$13,000,000,000, and that of the production of structural materials, including cement, sand and gravel, stone, clay products and lime, was estimated at \$461,206,000. The latter was about 10 p.c. of the total value of all mineral production and represented an increase of 4.0 p.c. over the 1968 total.

Cement.—There were 8,543,622 tons of cement produced in Canada in 1969, representing an increase of 5 p.c. over 1968. Although this quantity was slightly under the peak output attained in 1966, its value, at \$171,258,000, was the highest on record and constituted 3.6 p.c. of the value of all mineral production in Canada. Cement is produced in all provinces except Prince Edward Island but, of the total 1969 quantity, 66.2 p.c. was produced in Ontario and Quebec. The productive capacity of the Canadian cement industry in 1969 was 14,800,000 tons a year, which included the output of the new Bowmanville plant of St. Mary's Cement Co. Limited whose first shipments were made in January. Quebec's capacity will be increased in 1970 by the addition, by Independent Cement Inc., at Joliette, of two new kilns, each capable of providing 220,000 tons a year.

21.—Producers' Shipments and Value, Imports, Exports and Apparent Consumption of Cement, 1960-69

¹ Standard portland cement.

² Shipments plus imports less exports.

Sand and Gravel.—The principal uses for sand and gravel are as aggregate in concrete for building and engineering construction and as fill in road construction. Gravel in boulder sizes is used for rip-rap fill and sometimes for armour-stone construction; the normal scalped, over-size material is crushed to provide gravel and crusher-run fines. Lithologically, sand and gravel deposits are usually composed of material similar to the rock types in which the deposits are found; infrequently, deposits are composed of materials that have been transported some distance from their origin. Exploitation of these low-value-per-ton materials is greatly influenced by the physical characteristics of the sand or gravel, by the location of the deposit with respect to suitable markets and, of great importance, by the specifications established to differentiate quality products.

Stone.—The stone industry includes those companies producing dimension stone, ornamental stone, crushed stone, whiting, and stone for metallurgical and chemical use. Dimension stone products account for less than 1 p.c. of the total volume of stone production and over 11 p.c. of the total value. Crushed stone products, consisting of materials used for concrete aggregate, railway ballast, road metal, rubble and rip-rap, terrazzo, stucco and artificial stone, etc., account for about 80 p.c. of the total volume; the remainder is used in the chemical and allied industries.

¹ Excludes limestone used to make lime or cement.

Clay Products.—Common clays and shales occur in most regions of Canada and are the principal raw materials used for brick and tile manufacture. Deposits of high-quality argillaceous materials used for such products as papers, refractories, high-quality white-ware and stoneware products are relatively scarce in Canada. Consequently, china clay (kaolin), fire clay, ball clay and stoneware clay are mostly imported. The value of production of clay products from domestic clays reached a record \$50,995,000 in 1969.

Table 24 refers to production of such products as brick and tile made from domestic clays. Imports of these products, mainly from the United States, have a low total value. Other clay products such as floor and wall tile, sanitary ware, pottery and dinnerware, and electrical porcelain contain a large proportion of china clay and ball clay. The value of whiteware products produced in Canada from such materials approached \$40,000,000 in 1968.

Subsection 3.—Petroleum and Natural Gas

The Canadian petroleum industry in 1969 was highlighted by the widespread distribution of drilling operations and record production levels. Exploratory drilling was not only maintained at a high level in the traditional inland areas but was accelerated in Canada's frontier regions as Northern Canada continued to dominate the exploration picture. Pan-arctic Oils Limited, the government-industry syndicate, was rewarded with an initial success when the third well of their comprehensive drilling program in the arctic islands encountered an extensive condensate-bearing gas reservoir on Melville Island. The epic voyage of the United States tanker S.S. *Manhattan* through the arctic seas to Alaska in 1969 proved that it is physically possible for large tankers to operate in arctic waters. The successful adaptation of this method of transport or of the pipeline method to northern regions will undoubtedly have a critical bearing on the development of potential oil resources in Canada's arctic islands.

Strong demand for Canadian oil and gas in United States markets contributed significantly to the production gains of 1969. Total production of all liquid hydrocarbons—crude oil plus natural gas liquids—increased by almost 9 p.c. to 1,306,000 bbl. daily. Net production of crude oil averaged 1,119,000 bbl. a day and field and gas-plant production of natural gas liquids reached 187,000 bbl. a day. Alberta production, at 793,000 bbl. a day, accounted for 71 p.c. of the total Canadian crude oil output, 3 p.c. greater than in 1968. Production also increased in British Columbia, Manitoba, Ontario and the Northwest Territories but declined appreciably in Saskatchewan.

¹ Gross production, less field flared and waste, injected and stored.

Total liquid hydrocarbon reserves increased by 498,000,000 bbl. to 10,500,000,000 bbl., comprised of 8,620,000,000 bbl. of crude oil and 1,896,000,000 bbl. of natural gas liquids. The bulk of the reserve growth was attributable to the introduction of secondary recovery schemes and a large increase in natural gas liquid reserves rather than to the discovery of new oil fields. As in previous years, Alberta contributed the major additions to reserves and in 1969 had more than 89 p.c. of the total proved hydrocarbon reserves in Canada.

Net new production of natural gas rose 16.9 p.c. to 5,430,000 Mcf. daily in 1969 in response to the buoyant demand in domestic and export markets. Proved remaining marketable reserves rose 8.9 p.c. to 51,950,995,000 Mcf. in 1969, the second largest increase since 1955.

Exports of crude oil and products to the United States increased to 595,000 bbl. a day in 1969 with an estimated well-head value of \$579,179,000. Although exports reached record proportions, imports of crude oil and products still exceeded exports by 136,000 bbl. a day, for a daily average of 731,000 bbl.

Alberta.—Although exploratory drilling was maintained at a high level in Alberta during 1969, there were no significant oil discoveries made in the province. There has not been a major oil find in Alberta since the Rainbow Lake field was discovered in 1965; nevertheless, oil-field development remained at about the same level in most areas of the province in 1969 as in the previous year.

Encouraged by a rapidly rising export demand for natural gas, the search for gas reserves accelerated during 1969. Most of the activity was concentrated in the Rocky Mountain foothills of Alberta where major gas discoveries were made in isolated Devonian Leduc reefs near Strachan and Ricinus in 1967 and 1968. Further exploratory drilling in this area in 1969 resulted in the discovery of at least two more thick, "wet" gas-bearing Leduc reefs. Although the primary objective in the Strachan-Ricinus trend has been Devonian reefs, several of these deep tests have encountered commercial thicknesses of oil- and gas-bearing Cardium sandstone at shallower depths. The results of this drilling have not only added substantially to provincial reserves of gas and oil but have also focused the industry's attention on the potential of the relatively unexplored foothill belt.

In 1969, the Alberta Government granted Syncrude Canada Ltd. permission to proceed with construction of its proposed Athabasca tar-sand extraction plant near Fort McMurray, to cost \$190,000,000. Syncrude is owned jointly by Atlantic Richfield Company, Cities Service Athabasca Inc., Imperial Oil Limited and Royalite Oil Co. Ltd. Syncrude's application called for a daily production of 50,000 bbl. of synthetic crude oil, 25,000 bbl. of specialty oils and 5,000 bbl. of naphtha. In its application, Syncrude agreed to delay start-up time until 1976 from an initial target of 1972-73 in order to gain time in assessing the potential impact that future Prudhoe Bay production would have on prospective markets in the United States.

The total number of wells drilled in 1969 was 1,843, five fewer than in 1968. Total footage drilled was 8,596,021 feet, development footage 3,737,169 and exploratory drilling 4,858,852 feet, little changed from the preceding year.

Saskatchewan.—Saskatchewan experienced an upsurge in both exploratory and development drilling in 1969 but the results in terms of additions to reserves were disappointing. Exploratory drilling at 624 wells and 1,923,654 feet increased 10 p.c. and development footage at 538 wells and 1,728,425 feet was up 12 p.c. The exploratory venture undertaken by Pheasant Exploration Ltd. to assess the unexplored subsurface areas of the Middle Devonian Winnipegosis formation was abandoned after 48 dry holes had been drilled. Other deep-hole drilling projects also proved unsuccessful.

British Columbia.—Total footage drilled in British Columbia decreased from 1968 by 19 p.c. to 847,883 feet as a slight increase in development drilling was more than offset by a sharp reduction in exploratory drilling. The lack of significant oil finds in recent years apparently has begun to have a detrimental effect on exploration effort. In the off-shore areas, Shell completed its drilling program off the West Coast after drilling 14 wells. Drilling extended from off Pachena Point, Vancouver Island, to the northeastern coast of Queen Charlotte Island and although traces of oil and gas were encountered, commercial production was not indicated. A test-well drilled in the Bowser Basin of the northwestern interior of British Columbia was suspended after encountering gas shows at a depth of about 3,000 feet. Further production-testing was contemplated for this well in 1970.

Manitoba.—Aggregate drilling footage declined 9 p.c. in Manitoba during 1969 to 146,000 feet. Exploratory drilling footage increased 31 p.c. to 82,629 feet and although there was a notable increase in the number of wells drilled during the year, all were unsuccessful. Development drilling declined 37 p.c. to 63,318 feet, reflecting not only the lack of new discoveries but also pointing up the fact that the established fields have very nearly reached their maximum development.

Yukon Territory, Northwest Territories and Arctic Islands.—Exploration activity continued to increase in Canada's Arctic in 1969 and drilling results have confirmed both industry's and government's assessment of the potential of Northern Canada. Panarctic Oils Limited, the industry-government combine which is exploring for oil in Canada's arctic islands, has committed a minimum of \$30,000,000 toward the drilling of 17-20 exploratory wells. By the end of 1969, three wells in this program had been drilled, one of which dis-

covered very large potential reserves of natural gas at Drake Point on Melville Island; Panarctic plans on drilling at least one more well on Melville Island in the future. By the end of the year a third rig had been brought in to commence drilling on Ellef Ringnes Island to test a very large salt dome structure.

Exploration activity was also accelerated in the Mackenzie Delta region of Northern Canada and early in 1970 exploratory drilling was rewarded by a discovery made by the well I.O.E. Atkinson H-25 in the Northwest Territories, 50 miles northeast of Tuktoyaktuk. Preliminary indications are that the discovery is a substantial one and when the limited amount of drilling that has been done in the Mackenzie River Delta is taken into consideration, it is apparent that the discovery has major implications for future prospects.

Total footage drilled, all exploratory, more than doubled in 1969 to 56 wells (274,401 feet) from 33 wells (118,774 feet) in 1968.

Eastern Canada.—In Ontario, a sharp decrease in development drilling was more than offset by a major gain in exploratory drilling with the result that over-all drilling footage increased by 37 p.c. in 1969. The advance in exploratory drilling was due primarily to an increase in drilling operations in Lake Erie combined with an increased emphasis on Silurian reef exploration in Lambton County. A well drilled near the Kimball-Colinville field encountered oil in a Silurian reef and was the most significant discovery made in Eastern Canada during the year.

In the offshore areas, Shell Canada Limited has embarked on a two-year drilling program off the coast of Nova Scotia and by year-end had completed one well south of Sable Island and had commenced drilling a second well farther south; the first well was abandoned at a depth of 13,085 feet after encountering several minor indications of oil and gas. The first well in Hudson Bay was drilled in 1969 from a specially reinforced drilling vessel located about 250 miles east of Churchill, Man. Because of potentially hazardous ice conditions, the well was terminated at a depth of 3,926 feet, considerably short of a projected depth of 6,000 feet, after encountering indications of oil and gas in separate horizons.

Petroleum Refining and Marketing.—Daily crude oil refining capacity continues to increase year by year, the total in 1969 reaching 1,297,850 bbl. Canada ranks ninth in the world in terms of crude treating capacity and is unquestionably one of the most advanced countries in terms of down-stream refinery units such as catalytic cracking and catalytic reforming.

27.—Crude Oil Refining Capacity, by Region, as at Jan. 1, 1967-69

Region	1967		1968		1969	
	bbl./day	p.c.	bbl./day	p.c.	bbl./day	p.c.
Atlantic Provinces.....	128,500	10.6	128,100	10.5	132,600	10.2
Quebec.....	401,200	33.2	400,400	32.8	449,600	34.6
Ontario.....	352,400	29.1	359,100	29.4	367,000	28.3
Prairie Provinces and Northwest Territories.....	217,450	18.0	222,150	18.1	236,950	18.3
British Columbia.....	109,900	9.1	112,400	9.2	111,700	8.6
Canada.....	1,209,450	100.0	1,222,150	100.0	1,297,850	100.0

In 1969, Canadian refineries received 1,185,000 bbl. of crude oil, of which amount domestic oil accounted for 56 p.c. Imported crude, on an average daily basis, amounted to 522,000 bbl. with 346,000 bbl. coming from Venezuela, 45,000 from Iran, 33,000 from Saudi Arabia, 26,000 from the Trucial States, 22,000 from Nigeria, 14,000 from Iraq, 12,000 from Kuwait, 11,000 from Libya, 7,000 from Trinidad, 5,000 from Colombia, and 1,000 from the United States. Imports of refined products decreased to 203,000 bbl. daily, a loss of 1,000 bbl. daily over the 204,000 bbl. for 1968. Light and heavy fuel oil and diesel oil were the major categories of imports.

**23. —Domestic and Foreign Crude Oil Received at Canadian Refineries, by Region,
1967-69**

Region	1967		1968		1969	
	Domestic	Foreign	Domestic	Foreign	Domestic	Foreign

Ontario.....	309,964	1,157	328,804	1,288	340,727	1,155
Prairie Provinces and Northwest Territories.....	202,659	—	206,301	—	215,695	—
British Columbia.....	102,053	—	111,214	—	106,531	—
Canada.....	614,689	446,823	646,319	488,748	662,953	521,844

Domestic demand in 1969 was made up of 1,314,000 bbl. daily of sales to consumers and 90,000 bbl. daily used in the petroleum industry, a total of 1,404,000 bbl. daily compared with the 1968 level of 1,347,000 bbl. Exports of crude oil, all to the United States, averaged 555,000 bbl. daily and refinery product exports amounted to 11,298 bbl. daily.

Natural Gas Processing and Marketing.—Natural gas consumers and gas pipeline companies require gas that contains relatively little non-flammable content and is free of noxious components. Since a large proportion of gas produced in Canada does not meet market specifications, there is a major gas processing industry located mainly in Alberta which extracts ingredients that, in themselves, are valuable. These byproducts include propane, butanes, pentanes plus and elemental sulphur. At the end of 1969 there were 137 gas plants operating in Canada—122 in Alberta, four in British Columbia, seven in Saskatchewan and four in Ontario. The addition in 1969 of 619,000 Mcf. daily of raw gas treating capacity raised the total to 8,896,000 Mcf. daily.

Of the 2,202,000,000 Mcf. of Canadian gas plus imports of 34,900,000 Mcf. available for consumption in 1969, 680,100,000 Mcf. went to the United States, 844,700,000 Mcf. was sold to residential, commercial and industrial consumers in Canada, and the remainder was used by the industry in pipeline, field or plant use. In total, 1,027,200,000 Mcf. of gas was consumed in Canada compared with 917,100,000 Mcf. in 1968.

Table 29 shows sales of natural gas in Canada as well as the number of customers. During 1969, natural gas supplied roughly 22 p.c. of Canada's energy requirements.

Subsection 4.—Coal

The Canadian coal industry in 1969 was marked by expansion of the mining ventures in Western Canada and contraction of the established producers in the eastern provinces. A dramatic revival of the western Canadian coal industry commenced in April 1970, when the first large-scale shipments of coking coal moved from Alberta and British Columbia mines to West Coast shipping terminals and on to Japan. In early 1970, three coal companies—Kaiser Resources Ltd., Cardinal River Coals Ltd. and McIntyre Coal Mines Ltd.—began full-scale production. Six Western Canada coal companies have so far contracted to supply the Japanese steel industry by 1990 with over 180,000,000 long tons of coking coal having an established f.o.b. West Coast value of \$2,500,000,000. Thus far, all the expansion in Western Canada is based on the demand by the Japanese iron and steel industry for high-quality coking coal of which Canada has large resources, but Canada is in a position, in view of the present world shortage of coking coal, to supply not only Japan but other domestic and world markets as well.

As summarized in Tables 30, 31 and 32, coal production in 1969 was below that in 1968 as a result of decreases in Nova Scotia, New Brunswick and Saskatchewan. Small increases were again reported for production of subbituminous coal in Alberta and bituminous coal in both Alberta and British Columbia. Exports, principally to Japan, were about 1,380,000 tons, slightly below 1968 exports due to labour disputes on the West Coast. About 17,300,000 tons of bituminous coal were imported from the eastern United States for Ontario and Quebec consumers. Approximately 12,000,000 tons or 45 p.c. of the 26,300,000 tons of coal consumed in Canada in 1969 were used to generate electricity. For the same period, 6,900,000 tons of bituminous coal were carbonized to produce 5,000,000 tons of coke. The thermal-electric power industry and the iron and steel industries are the two largest groups of industrial consumers of coal in Canada. The average number of employees in the Canadian coal industry continued to decrease to 7,436; output per man-day from surface mines was 46.5 tons and from underground mines 3.5 tons.

A large face-loading shovel filling a 200-ton off-highway mining truck at a coal mining operation in British Columbia. Four to six passes of the huge shovel will load the truck, the size of which is indicated by the man in the foreground.

¹ Prior to 1964, figures include coal ex-warehoused for ships' stores.

² Coal and coke.

³ Excludes briquettes.

⁴ Includes foreign coal re-exported from Canada.

Provincial Production and Mine Developments

British Columbia.—In 1969, most of British Columbia's coal came from the Crowsnest Pass area; a small amount was recovered in the Smithers area as part of a salvage operation. In the Crowsnest Pass area the coal mining scene was dominated by the rapidly progressing developments of Kaiser Resources Ltd. Although Kaiser's production from its Michel Colliery remained below 1,000,000 tons, production will rise sharply in 1970 when coal is strip-mined from the 50-foot, No. 10 Balmer seam on Harmer Ridge. Annual production initially will be 7,000,000 tons, of which 5,000,000 tons will be exported.

In 1969, Fording Coal Limited announced the signing of a contract with Japanese interests for 45,000,000 tons of medium volatile coking coal to be delivered over a 15-year period. The mine, situated 35 miles north of Kaiser's mine along the Fording River Valley, is expected to be in production by early 1972. In December 1969, Cascade Pipe Line Ltd., another wholly owned Canadian Pacific subsidiary, applied for a permit to build a \$200,000,000 pipeline to carry coal 460 miles from southeastern British Columbia to the Roberts Bank port. This company is at present doing feasibility studies.

Alberta.—Alberta is Canada's leading coal-producing province and has the largest number of coal mines, although many are small mines with production of less than 25,000 tons a year. In 1969, Alberta coal production reached 4,400,000 tons, the highest in 14 years.

On the Alberta side of the Crowsnest Pass, Coleman Collieries Limited produced coking coal from its Vicary Creek underground mine with supplemental production from some small strip pits, to supply coal mainly to Japanese steel mills under the terms of a contract signed in 1967. To the north of the Crowsnest Pass in the Cascade coal area, Canmore Mines, Limited produced coal mainly from its underground mine with supplementary output from small strip operations. Canmore has an export contract to Japan for 3,800,000 long tons over 10 years and is planning to implement auger mining on its steeply pitching seams in 1970. At year-end, Cardinal River Coals Ltd. in the Coalspur area at Luscar had nearly completed the construction of a modern coal preparation plant and the pre-production stripping of overburden from the strip sites, and expected to begin shipping coking coal to Japan in 1970. For many years the coal resources of the Smoky River area, because of the absence of roads or railways, were not developed but, when construction started on the Alberta resources railway, McIntyre Coal Mines Limited began to look to an early utilization of their coal resources and obtained a contract in 1969 for coking coal. The railway was officially opened in May 1969. A new town, Grande Cache, was developed to accommodate the families of the anticipated 1,000 employees for the 2,000,000-ton-per-year mine.

In the plains area of Alberta, the shallow flat-lying subbituminous coal is produced primarily to supply thermal-electric power plants. Alberta Coal Ltd., which mines coal for Calgary Power Ltd. at Wabamun near Edmonton, has the largest subbituminous mine. Calgary Power is constructing an additional 300,000-kw. thermal power plant across Lake Wabamun from its other plant and Alberta Coal is preparing a new strip mine adjacent to this plant. Alberta Coal also operates mines through subsidiaries at Sheerness and at Halkirk in the Castor area. Forestburg Collieries Limited, a Luscar Ltd. subsidiary, has a large mine at Forestburg just north of Halkirk. Both these surface mines supply coal to the Canadian Utilities Battle River power plant situated between the two mines. Two moderate-sized underground mines still produce subbituminous coal in central Alberta—Century Coals Limited in Drumheller and Star-Key Mines Ltd. in the Edmonton district.

Saskatchewan.—In the Estevan area of southeastern Saskatchewan, lignite coal is strip-mined by highly productive mining operations owned by Alberta Coal Ltd., Manitoba and Saskatchewan Coal Company Limited and Utility Coals Ltd. The Saskatchewan coal mines have ideal mining conditions consisting of shallow overburden and fairly thick

coal seams that are mined by large dragline and shovel operations. This is reflected by the 59.3-ton output per man-day for Saskatchewan strip mines compared with the Canadian average of 46.5 for surface mines.

Yukon Territory.—In the Yukon Territory, the Carmacks coal mine was reopened by Anvil Mining Corporation Limited in 1969. Production from the mine will not be large and will be used at the Anvil silver-lead-zinc mine at Vangorda Creek to supply fuel for a coal-fired drying plant for concentrates.

New Brunswick.—New Brunswick coal production decreased about 12 p.c. to 702,000 tons in 1969 in line with the gradual phasing-out of the uneconomic coal industry at Minto. On Sept. 1, the New Brunswick Government formally took over all the surface and underground mines in the Minto-Chipman coalfields. A new provincial company—N.B. Coal Limited, a wholly owned subsidiary of the Grand Lake Development Corporation—was incorporated to take over and manage the New Brunswick coal mines.

Nova Scotia.—In 1969, Nova Scotia coal production was 2,600,000 tons from 10 operating mines. Of this amount the Cape Breton Development Corporation (DEVCO) produced 2,200,000 tons, all by underground methods from Cape Breton Island coal seams that dip under the sea. DEVCO took over the coal mines and related interests of the Dominion Steel and Coal Corporation, Limited, in March 1968 and, in line with a plan to reduce costly operations, lowered production by 18 p.c. and offered voluntary pre-retirement to about 1,000 older men of the total working force of 5,800. In June 1969, work began in DEVCO's new Lingan mine. This mine, which will produce relatively low sulphur coal for carbonization at DEVCO's coke oven plants, should be in full production in 1974. Bras d'Or Coal Company Limited shut down its Four Star Colliery in Broughton in late December.

Section 2.—Government Aid to the Mineral Industry

Subsection 1.—Federal Government Aid

Federal assistance to the mining industry takes the form of the provision of detailed geological, geophysical, topographical, geodetic, geographical and marine data which are of basic importance to the discovery and development of the mineral resources of Canada; the provision, through laboratory and pilot-plant research, of technical information concerning the processing of ores, industrial minerals and fuels on a commercial scale; financial and technical assistance to the gold-mining industry under the Emergency Gold Mining Assistance Act, and certain tax incentives.

The Department of Energy, Mines and Resources.—The federal Department of Energy, Mines and Resources came into being on Oct. 1, 1966. It embraces all of the functions of the former Department of Mines and Technical Surveys, and new functions pertaining to water and energy resources. Apart from its administrative establishments, the Department is made up of four Groups—Mines and Geosciences, Mineral Development, Water, and Energy Development—each headed by an assistant deputy minister and each aiding the Canadian mineral industry in some way.

The *Mines and Geosciences Group* contains four branches—the Mines Branch, the Geological Survey of Canada, the Observatories Branch and the Surveys and Mapping Branch. The Mines Branch is a large laboratory and pilot-plant complex carrying out applied and basic research to discover new and better methods of ensuring mine safety, extracting and refining ores and other minerals, and using metals and minerals in industry and defence. Gratifying results have been achieved in the extraction of metals from ores and in the refining of low-grade crude oil, in the automation of grinding circuits and cyanide leaching processes in gold mills and in the leaching of ground or crushed uranium ores by

bacteria; an example of work that has resulted in direct economic benefit has been the development of a process to produce metallurgical coke from western Canadian coal, made possible by a long-term contract to export coke to Japan. In pyrometallurgy—the extraction of metals by heat—applied research is concentrated principally on the combination of shaft and electric furnaces for smelting iron ore. In petroleum refining, research concerns hydrogenation, catalytic cracking, and catalyst development. This work is highly significant because of the opening-up of unconventional sources such as the Athabasca tar sands and the so-called Colorado oil shales, whose economic importance has been recognized by the Mines Branch for many years. A close tie-in with producers is maintained in mineral processing in which the emphasis is on the concentration of metallic ores and on the processing and improvement of industrial minerals. In the field of mineral sciences, the physical, chemical, crystallographic and magnetic studies being undertaken on sulphide minerals are of fundamental interest. In physical metallurgy, experiments on new alloy combinations continue to yield valuable practical benefits for Canadian industry.

The Mines Branch, on the advice of experts from industry and the universities, also awards an annual series of research grants in mining sciences to Canadian universities. In 1969, the total amount distributed was \$112,000.

The Geological Survey of Canada maps and studies the geology of Canada and carries out specialized research to enable its geologists to explain the geology of Canada more effectively. It is the major organization engaged in this work in Canada and its studies extend to all provinces and territories. The Survey maintains a close co-operation with provincial agencies. In the provinces, it endeavours, after prior consultation with the provincial government concerned, to fill in the province's geological framework and thus provide a basis for more detailed mapping by provincial geologists and commercial exploration companies. In areas under development, the Survey does more detailed mapping to supply industry with the geological key to the structures of the orebodies. Each year, the Geological Survey sends about 100 parties into many parts of Canada. They conduct broad regional investigations in the Canadian Shield, the Appalachian and the Cordilleran geosynclinal belts, the sedimentary basins of the mainland and the Arctic Archipelago, and in unconsolidated sediments. As the first systematic reconnaissance of Canada is approaching completion, the country's major geological features are reasonably well known and the Survey is giving increasing attention to fundamental research into field and laboratory problems, identified in the reconnaissance phase, to understand the geological evolution of the country. It publishes the results of its research in memoirs, bulletins, papers and maps, and in numerous scientific technical journals.

The headquarters of the Geological Survey is at Ottawa but it has several regional offices including the Institute of Sedimentary and Petroleum Geology in Calgary which serves the special needs of the western provinces. The Survey each year awards a large number of grants in support of geological research in Canadian universities; in 1969 these totalled \$275,242.

The Earth Physics Branch carries out much geophysical work of interest to the mineral industry. It studies, collects and publishes, in the form of maps and charts, information on the geomagnetic field in Canada. Most of the information published is obtained from airborne geomagnetic surveys, which have ranged over the whole of Canada and across the Atlantic to Scandinavia. In addition, the Branch has a network of nine permanent geomagnetic observatories, as well as temporary observatories in summer at many widely distributed sites. It also operates a network of 28 seismic stations to assist in the study of the earth's interior and to obtain data for its quantitative assessment of seismic risk throughout Canada. In gravity research, another means of studying the composition of the earth's crust, the Branch is systematically mapping variations in the earth's gravity on a regional basis throughout Canada, including the Arctic and the floors of the Gulf of St. Lawrence and Hudson Bay. The results of all gravity measurements to the end of 1966 are available in a new Gravity Map of Canada on a scale of 1:5,000,000, or about 80 miles to the inch, for easy comparison with the new Geological and Tectonic maps of Canada on a similar scale.

No mineral development is possible without accurate, large-scale topographical maps. The Surveys and Mapping Branch, in conjunction with the Mapping and Charting Establishment of the Department of National Defence, has completed the topographical mapping of the country at the medium scale of 1:250,000, or about four miles to the inch. About 35 p.c. of the larger-scale mapping at 1:50,000 has been completed in the more settled areas and areas of greater economic importance. (See also pp. 23-25.)

The *Mineral Development Group* is composed of the Mineral Resources Branch, the Explosives Division and the Quebec Regional Office. The Explosives Division is responsible for the administration of the federal Explosives Act which is primarily an Act of public safety to control the manufacture, authorization, storage, sale, importation and transportation by road of explosives.

The Mineral Resources Branch is responsible for resource-economic research, program development and policy formulation in the field of non-renewable resources. It conducts fundamental and applied resource-engineering-economic research and field investigations into non-renewable resource problems, policies and programs on a commodity or total industry basis, in a regional, national and international context. The work covers all aspects of the mineral industry from resources through exploration, development, production, processing, transportation and consumption. On the basis of this work, the Branch publishes resource-engineering-economic reports and advises government departments and agencies on non-renewable resource policy matters. Current activities include regional studies of the mineral economy of a number of areas in Canada; assessment of mineral projects in various parts of Canada for which federal support has been requested, mineral resource and mineral reserve studies in a number of mineral commodities, including the mineral fuels, uranium and coal; and the safeguarding of Canadian mineral interests through participation in international agencies such as the United Nations Lead-Zinc Study Group, the United Nations Steel Committee, the Organization for Economic Co-operation and Development, and the International Tin Council. The Branch administers the Emergency Gold Mining Assistance Act (see p. 722) as a means of aiding a number of mining communities largely dependent upon the gold mines. In collaboration with the Canadian International Development Agency and with the support of industry, the Branch is setting up training courses for mineral scientists, technologists and economists brought to Canada under the various aid programs, and is advising on mineral projects undertaken by Canada as an aid to developing countries. The Branch publishes an extensive series of reports and other material, and maintains the Mineral Occurrence Index, which is a listing of about 10,000 mineral showings and deposits in Canada that may be consulted by anyone interested.

The *Water Group* is charged with the Department's responsibility for advising on federal water policies and for co-ordinating the work of federal agencies in water resource management and water pollution. In addition to broad programs of hydrometric, oceanographic and hydrographic work, the Group undertakes and co-ordinates water studies at regional levels, conducts research on the relationships of water and renewable resources and maintains a continuing review of national and regional water policies and programs. The Group is composed of the Marine Sciences Branch, the Inland Waters Branch and the Policy and Planning Branch. Of particular interest to the mining industry are (a) the work being done by geophysicists of the Atlantic Oceanographic Group of the Marine Sciences Branch on the continental shelf off the Atlantic Coast and in the Gulf of St. Lawrence and (b) the study of pollution problems in mining areas, such as in northeastern New Brunswick and on the headwaters of the Saskatchewan River system, by the Inland Waters Branch.

The *Energy Development Group* has broad responsibilities relating to the development of plans and policies for all forms of energy; the development of programs, legislation and agreements to implement those policies; the direction of studies relating to energy sources and requirements; and the co-ordination of policy advice. The Assistant Deputy Minister serves as adviser on over-all plans and policies relating to energy sources and requirements.

Tax Incentives to the Mineral Industry.*—Although mineral industry enterprises are subject to federal income tax, there are certain benefits granted to such enterprises under the Income Tax Act which serve as incentives to exploration and development of minerals.

New mining operations based on metallic mineral deposits and most industrial mineral deposits are exempt from income tax for the first three years of operation. The three-year exemption does not apply to oil and gas wells, but does apply to the mining of oil shales and bituminous sand.

The operators of oil or gas wells or mines may claim, during the full life of the operation, a depletion allowance which is equal to one third of the taxable income. In general, the effect of the percentage depletion allowance is to reduce the tax otherwise payable by one third.

There are special depletion allowances for gold and coal mines. The operator of a gold mine may elect to apply a percentage depletion allowance rate of 40 p.c. or an amount of \$4 per ounce of gold produced as a deduction from taxable income. The deduction for coal is 10 cents for each ton of coal mined in the year.

Non-operators are entitled to a depletion allowance of 25 p.c. of their gross income from wells or most mines.

The right of a mining or petroleum company to claim costs of exploration and development incurred in the search for oil, gas or minerals in Canada as immediate deductions from income from all sources is generally regarded as an important tax benefit.

Prospectors and their financial backers are exempt from income tax on receipts from the sale of a mining property acquired as a result of the prospector's efforts, other than rents, royalties or similar payments.

Emergency Gold Mining Assistance Act.—Under this Act, which came into force in 1948 (RSC 1952, c. 95), financial assistance is provided to marginal gold mines to counteract the effects of increasing costs of production and a fixed price for gold. By enabling gold mines to extend their productive life, the subventions help communities dependent on gold mining to adjust gradually to diminishing support. The application of the Act was extended to Dec. 31, 1970 by an amendment passed on Nov. 28, 1967. The Act is administered by the Department of Energy, Mines and Resources.

An amendment to the Act in 1963, which extended provisions of the Act to Dec. 31, 1967, also introduced a restriction which affects lode gold mines coming into production after June 30, 1965; such mines are eligible for assistance only if the mine provides direct economic support to an existing community, that is, if the majority of the persons employed at the mine reside in one or more of the established communities that are specified in a schedule to the Act. The restriction does not apply to lode mines in production before July 1, 1965 nor to placer gold mines.

The amount of assistance payable to an operator is determined by a formula and is based on the average cost of production per ounce and the number of ounces produced; it ranges from zero to \$10.27 per ounce produced. Gold mines having a cost of production of \$26.50 or less per ounce receive no assistance and those having a cost of production of \$45 or more per ounce receive the maximum rate of \$10.27 per ounce.

Under the current formula, the assistance payable to the operator of a gold mine is computed by adding 25 p.c. to the product of two factors—the "rate of assistance" and the number of "assistance ounces". The number of assistance ounces is two thirds of the total ounces produced and sold to the Royal Canadian Mint by a mine in a calendar year. The rate-of-assistance factor is two thirds of the amount by which the average cost of production exceeds \$26.50. The rate-of-assistance factor is limited to a maximum of \$12.33 which is reached when the average cost of production rises to \$45 per ounce of gold produced. The average cost of production is determined by dividing the total allowable costs by the total number of ounces produced in the form of bullion from the mine in a calendar year.

* As at June 1970.

Only those ounces of gold that have been sold to the Royal Canadian Mint are eligible for inclusion in the assistance-ounces factor. The cost of production includes mining, milling, smelting, refining, transportation and administration costs. Allowances are made for depreciation, pre-production costs and expenditures on exploration and development on the mine property in accordance with the Regulations.

The amounts paid to operators of gold mines to Mar. 31, 1969 for the years 1948-68, inclusive, totalled \$261,293,250 on a production of 57,155,705 oz. t. of gold produced and sold in accordance with requirements of the Act. The assistance payable for gold produced and sold under the Act in the calendar year 1969 was estimated to be \$13,502,000.

In March 1968, the governors of the central banks of seven nations introduced a two-price system for gold which separated transactions in gold among the central banks from private open-market operations. The governors agreed that the existing official reserves would be used only in transfers among monetary authorities at the established price of \$35(U.S.) an ounce, and that the central banks would neither purchase nor sell gold in private gold markets. The Minister of Finance stated that Canada would support fully the agreements reached by the central bankers. He also stated that there would be no change in the practices applicable to gold producers under the Emergency Gold Mining Assistance Act.

Operators of gold mines were thus offered the alternatives of selling their production to the Royal Canadian Mint at the fixed price of \$35 an ounce in United States funds in order to qualify for assistance payments under the Emergency Gold Mining Assistance Act or of selling on the open market at the price determined by supply and demand. It may be noted that the amount of assistance payable is determined on the basis of the cost of production and is not related to the selling price of the gold.

FEDERAL RESEARCH ADVANCES CANADIAN MINERAL DEVELOPMENT*

Mineral deposits are unique to a country—they are part of a country's 'patronymy', so to speak; methods of mining have to be designed to suit particular deposits and to ensure that the minerals are extracted safely and efficiently to the economic advantage of the country. Thus, Canada's great diversity of mineral resources, its own needs for mineral products and the maintenance of its large mineral export industry, which now accounts for about 60 p.c. of the value of all mineral output, together justify a strong research and development effort by government as well as by industry, universities and equipment manufacturers.

The Mines Branch of the Department of Energy, Mines and Resources is the Federal Government's agency dedicated to assisting in achieving Canada's goals of a continuously prosperous and competitive mineral industry which, deriving its wealth from a rich endowment, has traditionally contributed greatly to the high standard of living of Canadians. The Branch is a multi-discipline institution organized to provide knowledge and to conduct its own research or co-operate with Canadian industry and universities in research in the spectrum of non-renewable resources—metallic or non-metallic ores, fuels, structural materials and metals. It must maintain both flexibility and versatility in its attitudes and programs; it must contribute to the development of new or scarce minerals, like ores of caesium, tantalum or tin and manganese, and, at the same time, not overlook any mineral that may currently be regarded as uneconomical or even passé, like coal. In other words, the efforts of the Mines Branch, through its complex of laboratories and pilot plants and its scientific staff, are directed toward assisting the Canadian mineral industry in the more efficient extraction and elaboration of mineral wealth of all types and toward improving and broadening the uses of metals and minerals.

The following paragraphs give examples of the types of programs now under way in the Mineral Science Division and in the Fuels Research, Mining Research and Metals

* Prepared under the direction of Dr. John Convey, Director of the Mines Branch, Department of Energy, Mines and Resources, Ottawa.

Reduction and Energy Centres. In addition, a wide variety of projects are undertaken by the Mineral Processing Division to develop new and improved processing procedures for the economic recovery of minerals from specific Canadian ores; continuing research on metallurgical processing, pollution control and metal corrosion is carried out by the Extraction Metallurgy Division; and Physical Metallurgy Division programs consist essentially of applied research and development related to the conservation, processing, properties and utilization of Canadian metals. The Branch identifies and predicts problem areas in co-operation with the Canadian mineral industry through the National Advisory Committee on Mining and Metallurgical Research.

The work of the *Mineral Sciences Division* in the R and D support of the mining and metallurgical industries of Canada is characterized by the application of increasingly sophisticated techniques of science and technology, some of which, until recently, would have been regarded as being relevant only in a highly academic area of study. Examples of this trend are in the use of Mössbauer spectroscopy, neutron-activation analysis and electron microprobe analysis.

Extensive studies have been conducted of mineral occurrences in certain areas of Canada where rich mineralization occurs but where complications are encountered in identifying and characterizing the mineral assemblages. Areas in which such studies are being conducted include the silver deposits of the Cobalt-Gowganda area of Ontario, the disseminated copper-molybdenum deposits of the Highland Valley area of British Columbia, the base metal deposits of the Red Lake area of northwestern Ontario and, most recently, the tin deposits of the Mount Pleasant area of New Brunswick. In addition to the conventional tools of the mineralogist and the petrographer, such as the optical microscope, the use of the electron micro-beam probe has been of great value in solving the problems of the composition and structure of the complex intergrowths of a multitude of minerals, many of them uncommon and some completely new, that have been encountered in these deposits. The information made available is of assistance to the ore-dressing engineering in devising appropriate methods of extraction and beneficiation of the mineral values in the deposit.

One of the problems in ore treatment is to be able to monitor and control the process of beneficiation and to be able to do this continuously and without the need for delays and stock-piling while analyses are performed by conventional means at various stages. While X-ray fluorescence analysis has been used for this purpose for several years in some beneficiation plants, difficulties of monitoring and control have been experienced. The Mineral Sciences Division is attempting to refine the method and to eliminate these difficulties. For example, the on-stream analysis of ore-slurries applied to the copper-zinc ores from northern Manitoba is under study to characterize such parameters of the slurry as density and particle size, as well as composition, and to use these parameters to control the whole flow of the slurries through the beneficiation plant. In addition, consideration is being given to the use of more novel methods of the radiation-monitoring of mineral slurries employing radioactive isotopes and related procedures as the sensing and control device. These techniques have the advantage that, if they can be brought to a successful completion, the method will be continuous, non-destructive and self-controlling.

Standards have characterized trade in metals, minerals and chemicals for the past twenty years. Canada, as an important trading nation, particularly in the minerals/metals field, participates in standardization programs on a national and international basis. The contribution of the Mineral Sciences Division to this work comprises the development of internationally accepted methods of analysis of ores, minerals and metals for a wide range of metallic and non-metallic elements. Standard methods are, of course, vital in the field of commerce so that both vendor and customer shall be equitably treated. For many years, the Mineral Sciences has participated in programs for the development of standard analytical procedures, largely by conventional chemical and instrumental methods. More recently, the techniques of atomic-absorption spectrometry and of neutron-activation analysis have played an important role. Most recently, this type of work has been ex-

Elements of the earth's crust may be quantitatively analysed very rapidly by this electron microprobe in use in the Mineral Sciences Division. This facility is an essential time-saving tool in modern mineral technology, particularly in preliminary assessments as it identifies the form in which the valuable element occurs and indicates the feasibility of its recovery.

tended to an attempt to provide standard reference ore minerals. An example of this work is in the development of a standard Mo/Bi ore from Quebec. The analyses were performed by X-ray fluorescence and then statistical procedures were used to assess the validity of the sampling procedures and the reliability of the analytical method itself. Similar statistical methods are being applied to noble-metal analyses in order to establish internationally acceptable standard procedures.

The *Fuels Research Centre* is concerned with the development of new engineering and scientific approaches to encourage the efficient utilization and conservation of Canada's coal, petroleum and natural resources. As the utilization of these resources inevitably gives rise to the pollution of the environment, the Fuels Research Centre has shared public interest in and concern for their effective use and development. This recent public awareness of the magnitude and seriousness of the pollution problems has led to a rather abrupt change in attitude which is now being expressed in terms of legislation.

However, the enactment of legislation and the establishment of limits and penalties is one thing, but overcoming the technical difficulties to achieve these desired limits is another. It is in this area that the Fuels Research Centre is attempting to assist industry in finding practical solutions to some of the atmospheric pollution problems. A continuous effort is required because advances in technology will be offset by two factors that will tend to increase atmospheric pollution—the growth in population and the migration of people to the larger urban centres in search of employment. It is evident that balance must be maintained between regional planning and the rate at which industry can apply new technology to achieve atmospheric-quality standards.

In 1969, the Fuels Research Centre regrouped its research activities into programs associated with the major national needs, permitting better financial support and control. Three basic programs now function—air pollution and combustion research, the evaluation of the quality of Canadian fossil fuel resources, and research associated with the certification of electrical equipment for use in coal mines or industrial locations where combustion gases are present. At the same time, the activities of the Metallurgical Fuel Engineering Section were enlarged and combined with a portion of the Extraction Division to form a new research organization called the Metals Reduction and Energy Centre.

The air pollution and combustion research program includes projects concerned with the improvement of the combustion process and elimination of pollutants, from combustion, by chemical reaction and subsequent dispersion into the atmosphere, and with the elimination of sulphur from the fuel and the improvement of fuel quality before combustion. In the former, the emphasis is on the mechanism of combustion and the study of flame aerodynamics to reduce pollution, and also on the dispersion of smoke plumes from the stacks of large thermal power plants.

The elimination of sulphur from oils prior to combustion falls into two categories—the elimination of sulphur from residual oil obtained after the distillation of a normal crude oil and the removal of sulphur from low-grade heavy crude oils, such as the Athabasca bitumen. With the development of increasingly stringent air pollution regulations, the markets available for both types of oil will become more restricted. Since the economy can be sustained only by an abundant supply of cheap energy from these sources, the core of the high-pressure hydrogenation research is directed to the elimination of sulphur from these fuels at reasonable cost and to the encouragement of their efficient use.

Much of the pollution that arises from the combustion of low-grade petroleum is due to the sulphur and a significant advance has been made in the development of superior chromatographic columns for the separation of sulphur compounds, on a preparative scale, into major classes. The development of analytic capability is an important segment of research because the benefits are felt in a wide variety of problems extending from the resource evaluation program to the identification of oil in major oil spills such as have occurred in recent months.

The continuing tension in the Middle East and the shortage of natural gas and of cheap sources of petroleum in the United States have spurred interest in developing Arctic sources of petroleum and in reviewing North American fossil fuel resources. The Fuels Research Centre is particularly concerned with the evaluation of the quality of the Canadian portion of these reserves and with the development of improved techniques for obtaining sulphur-free petroleum from low-grade oil sands.

A directory of Canadian oil analysis and reservoir data has been prepared which includes most of the oil analysis conducted over several years at the Fuels Research Centre and is representative of all significant Canadian oil fields.

The *Metals Reduction and Energy Centre* studies the energy requirements of the Canadian metals and minerals industries and assesses the technical and transportation problems encountered in supplying energy needs of these industries. The technology of the application of energy to metallurgical processes is developed through study of processes for the reduction of metal ores and the carbonization (and other conversion processes) applied to fossil fuel resources to enhance their usefulness and value. Although Canada is generally thought to be a mineral-rich country, in fact, the only fossil fuel available in the entire central and eastern part of the country is the reserve in Nova Scotia. Not only are fuels not in good supply, but new economical hydro-power sites, although once numerous, are now very scarce. Atomic energy may represent the ultimate solution but energy from this type of generating station is at present neither available in quantity nor at attractive cost. It is expected that the transition period may last as long as 20 years so that, currently, the industrial centres of Canada are more dependent than ever before upon distant or external energy resource minerals to accommodate constantly growing energy-using in-

dustries. In terms of both volume and value, iron is by far the most important metallic ore processed and, since the iron ore industry developed at a later date than the steel industry and produced largely for export, it has a distinctly separate "industrial fabric" from the steel industry. It is now apparent that new methods of converting iron oxide to the metallic state are reaching industrial maturity but it is not yet clear whether this new and important processing step will be part of the steel or of the iron ore industry. Since energy costs make up as much as 70 p.c. of the operating costs of iron reduction processes, the location of the processing plants and the type of reductant to be used will have a profound effect on the future development of this important branch of the metals industry. The Centre carries out research and development into new methods of iron reduction, follows the development processes elsewhere, and takes special interest in the technical factors governing their energy requirements and the savings inherent in new methods of interconnecting iron and steel-making processes.

With respect to the conventional iron-producing process, the Centre is concerned with the provision of coke for the iron blast furnace. This work involves the evaluation of new coals becoming available in Western Canada for both export and domestic use, coals from the United States being used by the Ontario steel industry, new methods of upgrading fine coal to produce low-ash and low-sulphur coals, new methods of dewatering coal using oil-assisted drying methods, and improvements to the coking process itself. Entirely new methods of coking are also being investigated, particularly the type of process known as "form-coking", which embraces special methods of upgrading and agglomerating coal as well as the novel coking step itself.

A nuclear magnetic resonance spectrometer is used in the Fuels Research Centre to study heavy oils, thereby assisting in the development of new refining strategies needed to achieve more efficient methods of producing commercial products.

The Centre is involved in several aspects of transporting coal from mine to market. Of particular importance is the study of the hydraulic transport (by pipeline) of coal slurry to be used for coking; in this connection, a solution to the problem of dewatering and sizing to meet coking requirements is in process of development. Also under study is the problem of transporting coke where its low-bulk density is a major disadvantage. The application of carbonization technique to the treatment of low-rank coals to allow their economic transport for use as a reductant in some direct reduction iron processes, and even for combustion purposes, is being investigated.

The Metallurgical Fuels Engineering group of the Centre serves the technological requirements of the coal and coke industries of Canada. It is seeking ways and means of assisting the coal industry by assessing the coking properties of Canadian coals in aspects related to exploration, mining, beneficiation, transportation, utilization, and quality control; and of assisting the coke industry in the improvement of coke quality, the selection of coals for the manufacture of coke, the development of new techniques, and the modification of existing processes for the production of high-carbon products for specific markets.

The *Mining Research Centre* carries out research in those phases of mining up to mineral processing, including blasting, rock breakage, ground control, mining systems and environmental control. Personnel and research facilities are located at four laboratories—Canadian Explosives Research Laboratory, Ottawa; Rock Mechanics Laboratory, Ottawa; Elliot Lake Laboratory; and the Western Office, Calgary.

The Canadian mining industry is large by world standards and produces almost a complete range of metals and industrial minerals. Mining conditions vary from the "soft" yielding ground of the potash mines in Saskatchewan to the "hard" rock mines of the Canadian Shield. Although some orebodies will continue to be found near the surface, future trends will be toward deeper mining, both underground and in open pits. Problems encountered at depth will be more severe than those now existing and the present basis of engineering experience and trial and error procedures may not be sufficient to deal effectively with them. Consequently, a scientific base is required to aid judgement on what should be done once they occur. At present, research is not at a stage of providing complete solutions to mining problems; rather, it provides relevant information to mine operators which assists them in making decisions.

Both basic and applied research is carried out at the Centre. Basic research is aimed at providing a scientific basis for all phases of mining; applied research involves the present-day problems in mines using the knowledge and experience already available. About half of the research work is done in the mines in active participation with the mining companies. Co-operative research is also carried out with other federal and provincial departments, Canadian universities and research foundations.

The *blasting research* program is concerned with increasing safety and reducing the cost of drilling and blasting. During 1970, about 600,000,000 tons of ore and waste rock were excavated at a cost of about \$130,000,000 for drilling and blasting. A modest improvement in design criteria, based on the rock and explosive properties and their influence on blasting, could lead to considerable financial savings.

The imposed stresses have been evaluated for column charges, using analytical techniques, laboratory-testing and field trials and there is reasonable agreement with field measurements. The zone of fragmentation can be predicted, knowing the stress distribution in conjunction with a fracture criterion for the rock. In this way, borehole spacing and amount of charge required for optimum blasting can be evaluated. Another part of the blasting program is evaluating the effectiveness of pre-splitting as a means of reducing structural damage to open-pit walls due to explosive action. This is done by measuring accelerations produced by various blasting configurations.

The Canadian Explosives Research Laboratory provides technical assistance to Canadian regulatory agencies responsible for the establishment of standards for transportation, storage and use of explosives and dangerous goods. During the past few years there

has been a considerable expansion in the variety and amount of blasting agents and dangerous goods. There is a continuous need to update regulations and to improve methods of testing these materials.

The objective of *rock breakage* research is to investigate the mechanics of breakage, other than explosives, at the rock face and in grinding processes. Research on the thermal/mechanical breakage of rock particles on laboratory-size samples showed that pre-heating results in easier grinding. Greatest benefit was obtained with silica-bearing ores, whereas calcareous ores were hardly affected.

A large number of variables are involved in mill circuits, and it is difficult to evaluate the importance of any one variable. With the advent of computers, large volumes of mill data can be analysed to develop mathematical models describing mill behaviour. Computer simulation should then be a means of optimizing operating conditions. The expected benefits would be reduced cost and/or increased mineral recovery.

In recent years, increased use has been made of tunnelling and raise-boring machines in mines and civil engineering projects. Within this concept of new methods of breaking rock, wedging tools for tunnelling machines and the feasibility of automating raise-boring machines are being investigated.

The *ground control* program deals with the stability of the rock around mining excavations. Basic research is concerned with developing mathematical models for predicting stresses and deformations of rock structures using finite element techniques. The aim is to provide a theoretical basis similar to that which has existed in other branches of engineering for many years. It has always been realized that structural geology plays an important part in the stability of a structure, without knowing how important. Present investigations are clarifying the picture by measuring the effect of geological weakness planes on stress distribution and strength of the rock mass. Research in mines essentially involves taking measurements of stress and deformation, which in turn requires adequate instrumentation. In North America the Mining Research Centre has pioneered the strain cell overcoring technique of stress measurement, and multi-wire borehole extensometers. Both systems are now in common use in Canadian mines.

Applied research is conducted almost exclusively in the mines throughout Canada. Partly as a result of in-situ measurements, two room-and-pillar mines have been able to increase their extraction. Considerable work has been done on rock bolts as a means of artificial support. The testing of individual bolts to define anchorage capacity, and the monitoring of bolt loads and deformation of the roof strata have been used to define the adequacy of these support systems. Measurements of fill pressure and movement of the surrounding strata are being taken to define the stabilizing effect of rock/sand/cement fill.

Open-pit mines account for approximately 60 p.c. of the excavated tonnage in Canada, and any, even slight, increase of slope angle results in enormous savings in reduced waste removal or increased ore recovery. A small field trial, using cable bolts to artificially support a slope, indicated that this method was technically and economically feasible. There has been a resurgence in the coal mining industry of Canada, and a new Western Office in Calgary is at present investigating mining conditions in these mines.

Miners, because of their working environment, are susceptible to lung diseases. The objective of the *environmental control* program is to improve the quality of mine air. Other industrial countries as well as Canada are reviewing the standards for mine air. To ensure that these standards are realistic for Canadian conditions, a comprehensive knowledge of the dust and radiation hazard is necessary. In close co-operation with the Mines Accident Prevention Associations of Ontario and Quebec, and the McIntyre Research Foundation, work is proceeding on developing standard methods for measuring dust and radiation. Various dust sampling instruments from many countries have been calibrated under controlled conditions in the laboratory. There is considerable variation in the results from each instrument. The problem is compounded by not knowing whether mass, volume or size is the important parameter with regard to health hazard. Present work is concerned with the compositional analysis of airborne dust using X-ray techniques.

In some mines, vast quantities of air are required to keep the dust and radiation concentrations down to acceptable levels. Considerable savings may be possible if part of the air can be passed through filters and then recirculated. In co-operation with one mining company, 24 commercial filters were tested underground. Efficiency ranged from 20 p.c. to 100 p.c., with the better filters tending to be relatively expensive and having a short life. Where ventilation costs are an appreciable part of the total operating cost, the initial capital and replacement costs of filters are low enough to result in appreciable savings.

The cost and performance figures of typical mining operations are being investigated in the *mining systems* program. With the use of computers, optimization analyses are carried out on the various factors involved.

One study has investigated the costs of longhole drilling with regard to borehole diameter, length and inclination, by conducting a comprehensive field test. Briefly, it was found that costs increase with borehole diameter, and rise significantly with borehole depth. Holes that are horizontal to $+60^\circ$ cost less to drill than downholes. Another project is concerned with the optimum combination of primary and secondary breakage and loading at an open-pit mine.

Besides the research activity, the Centre provides a technology service to the mining industry. The Mining Information Centre assists industry and universities in finding research information on any phase of mining. In addition, the presence of a multi-discipline group of engineers and scientists in Canada provides an opportunity for mining personnel to discuss their problems and have a "sounding board" for their new ideas on improving mining. This facility is increasingly recognized and used by the industry.

Subsection 2.—Provincial Government Aid*

Newfoundland.—The Newfoundland Government, through the Mines Branch of the Department of Mines, Agriculture and Resources, provides several valuable services to those interested or involved in exploration and mining, including: the conduct of a continuing program of mineral assessment designed to encourage development of the mineral resources of the province; the inspection of exploration work carried out on concession areas and the examination of mining operations; the administration of beaches (control of removal of sand and gravel as a conservation measure) and the collection of data relevant to the control of sand removal; the identification of mineral rock specimens submitted by the public and the examination of corresponding occurrences where such is warranted; the dispensing of technical advice, in so far as possible, to those who seek such service (i.e., in hydrological problems and on the availability of quarriable peat moss to be removed by permit); co-operation with the Geological Survey of Canada and other Federal Government agencies; and the preparation and publication of data useful for educational and general informational purposes, including the preparation of mineral and rock sample sets. Geological reports, geophysical maps and compilations of general data pertaining to specific areas are procurable at nominal cost and other information from unclassified files is made available to interested parties. Prospector's or miner's permits are issued by the Mines Branch and mining claims are recorded.

Nova Scotia.—Under the provisions of the Mines Act (RSNS 1967, c. 185), the Government of Nova Scotia may assist a mining company or operator in the sinking of shafts, slopes, deeps and winzes and the driving of adits, tunnels, crosscuts, raises and levels. This assistance may take the form of work performed under contract, the payment of bills for materials and labour, or the guarantee of bank loans. Any such work must be approved by the Department of Mines. Mining machinery and equipment to be used in searching for or testing and mining minerals may be made available through the Government. Such equipment is under the direct supervision of the Chief Mining Engineer.

* Compiled from material supplied by the respective provincial governments.

The Government of Nova Scotia is also empowered to make any regulations considered necessary for increasing the output of coal. Such regulations cover the appropriation, on payment, of unworked coal lands, the operation of coal mines, and loans or guarantees for loans. Close co-operation is maintained with the Federal Government in carrying out federal regulations made to secure increased production and economical distribution of coal from the mines of the province.

New Brunswick.—The Mines Division of the Department of Natural Resources has three Branches. The *Mineral Resources Branch* administers the disposition of Crown mineral rights including the issuing of prospecting licences, recording of mining claims, issuing of mining licences and leases and other matters pertaining thereto. Detailed and index claim maps are prepared for distribution. The Branch is responsible for general and detailed geological mapping and investigations. Maps and reports are prepared for distribution, mineral and rock specimens are examined for prospectors and preliminary examinations of mineral prospects are made when requested and circumstances warrant. The *Mines Branch* administers the safety regulations governing operations under the Mining Act. All mines are regularly inspected, laboratory facilities are maintained and certain equipment used in mines must be approved. The Branch is responsible also for the collection of mining taxes and royalties and the preparation of statistics on mineral production. The *Water Branch* administers the Water Act, is responsible for the use and allocation of all surface, ground and shore waters and for pollution control measures and implements policy matters as determined by the New Brunswick Water Authority. A Regional Office located at Bathurst, staffed by geologists and inspectors, serves as a recording office for northeastern New Brunswick and another at St. George, staffed by a senior geologist, conducts regional work and assists exploration companies and prospectors working in the southwestern area. Claim maps and topographical, geological and aeromagnetic maps are available for perusal and distribution.

Quebec.—Through its Director-General of Mines, the Department of Natural Resources is responsible for implementing the Mining Act (SQ 1965, c. 34) and the Mining Duties Act (SQ 1965, c. 35). The directorate includes the following three branches: Geological Services, Mining Services and the Mining Research Centre, as well as the Taxation, Mining Conflicts and Registry Divisions.

The Geological Services Branch is concerned with geological exploration, mineral deposits, mapping and hydrogeology. It conducts studies on the geological composition of Quebec territory for the development of mineral resources; following yearly expeditions, detailed reports of the findings and geological maps of different regions are made available for the use of interested persons. The Hydrogeology Section conducts studies on and maintains an inventory of underground water. The Gas and Oil Section collects and compiles technical information for the use of private companies seeking hydrocarbons.

The Mining Services Branch, consisting of a Mines Service, an Inspection Service and an Engineering Service, controls mining concession grants on Crown lands, including claims registrations, developmental work permits and special permits for the sale or rental of lands for mining development. It ensures that holders of mining rights live up to the conditions of their agreements and inspectors ensure that work in mines, in quarries and in treatment plants is carried out in accordance with safety law and regulations. The Branch undertakes the engineering studies required prior to opening up a new mining district or operation, including the construction of access roads, the building of mining camps or townsites and any regulations pertaining to the use of the land in question.

The function of the Mining Research Centre is to assist those interested in prospecting, mining operations or ore treatment by providing technical and scientific services. In addition to chemical, physical, mineralogical and petrographic analyses, the Centre conducts applied research, principally mineralogical, to promote the development of new deposits in Quebec and to assist in the technological advancement of mines and quarries already in operation.

The Taxation Division levies duties on mining operations as stipulated in the Mining Duties Act and the Mining Conflicts Division verifies the existence or the validity of claims as provided for in Part VI of the Mining Act.

To provide for the future development of the mining industry, scholarships are granted to students wishing to follow a career in geology, mining and metallurgical engineering, as well as to students in hydrology or other relevant fields of science (hydro-electricity, hydraulics or meteorology). The Department makes a conscious effort to initiate young students at the secondary or junior college levels into the mining and geological sciences by seconding staff members to camps for young scientists to interest them in these disciplines.

Ontario.—The Ontario Department of Mines renders a multiplicity of services of direct assistance to the mining industry within the province. The *Geological Branch* carries on a continuing program of geological mapping and investigations and prepares, for the use of the public, detailed reports and maps of the areas studied. In many active areas of the province, resident geologists gather and make available to the public information concerning geological conditions, exploration and development within their respective districts. A geologist specializing in industrial minerals investigates methods of treatment and recovery of such minerals and compiles data on the uses, specifications and markets for such products. During the winter months, courses of instruction for prospectors are held in various centres throughout the province.

The *Laboratory Branch* provides assay and analytical services and conducts mineralogical investigations to aid in the discovery and development of mineral deposits. Its services are available to the mining industry and the public at large. The Temiskaming Testing Laboratory, situated at Cobalt, operates a bulk sampling plant and assay laboratory to assist the producers of the area in marketing their silver-cobalt ores.

The *Mining Lands Branch* handles all matters dealing with the recording of mining claims, assessment work, etc., and the preparation of title to mining lands. As a service to the mining public, individual township maps are prepared and kept up to date, showing lands open for staking and recorded and patented claims therein. District Mining Recorders maintain offices at strategic locations throughout the province.

The *Inspection Branch* administers the operating rules of the Mining Act which call for the regular examination of all operating mines, quarries, sand and gravel pits and certain metallurgical works with a view to ensuring proper conditions of health and safety to the men employed. District offices to serve the local areas are maintained in the major mining centres of the province. Mine rescue stations in the principal mining sections are operated under the supervision of the Branch and all hoisting ropes in use at mines are periodically tested by a Branch-operated cable-testing laboratory.

The *Finance and Administration Branch* includes an Information Section which carries out a regular publicity and information program and maintains a library of films on mining subjects which are available for free loan to the public. Each year, displays pertaining to mining are prepared and presented at exhibitions throughout the province. A new section has recently been set up within the Branch consisting of two economists and a statistician, the function of which is to provide projections of Ontario's mineral economy for the industry. The Publications Office of the Branch is responsible for distribution of all departmental literature and maps.

Since 1951 the Department has been engaged in a road-building program to give access to mineralized areas and open them for full development. In 1955 this became an inter-departmental project with other interested departments participating through an inter-departmental committee of Ministers which decides on priorities and locations. Actual construction is carried out by the Department of Highways.

Manitoba.—The Mines Branch of the Manitoba Department of Mines and Natural Resources offers four main services of assistance to the mining industry: maintenance, by the Mining Recorder's offices at Winnipeg and The Pas, of all records essential to the grant-

ing and retention of titles to every mineral location in Manitoba; compilation, by the geological staff of the Branch, of historical and current information pertinent to mineral occurrences of interest and expansion of this information by a continuing program of geological mapping; enforcement of mine safety regulations and, by collaboration with industry, introduction of new practices such as those concerned with mine ventilation and the training of mine rescue crews which contribute to the health and welfare of mine workers; and maintenance of a chemical and assay laboratory to assist the prospector and the professional man in the classification of rocks and minerals and the evaluation of mineral occurrences.

To encourage the exploration for minerals in Manitoba, the Mineral Exploration Assistance Act was passed in April 1966. This Act provides for the payment of advances to individuals to assist in defraying the cost of exploration within designated areas. If assisted exploration results in the discovery of a deposit, the grant is repayable from the profits of the mine; a grant for exploration that proves unsuccessful is not repayable.

Saskatchewan.—The *Mineral Lands Branch* of the Department is responsible for making disposition of all Crown minerals and maintains records respecting areas let out by lease, permit or claim. Recording offices, located at Regina, La Ronge, Uranium City and Creighton, assist the public in determining the lands available and accept applications.

Officers of the *Mines Inspection Branch*, under the authority of the Mines Regulation Act, make regular examinations of all mines to ensure proper conditions for the health and safety of the men employed. Safety education, particularly in the form of first aid and mine rescue instruction, is also a part of the work of this Branch. All Branch officers are stationed at the Regina headquarters.

The Precambrian Geology Division of the *Geological Sciences Branch* conducts geological surveys in the shield areas of the province and publishes maps and reports for the information and guidance of the industry. Resident geologists are maintained at Uranium City and La Ronge and at the latter centre a laboratory provides for the storage and examination of core and samples. The Division processes exploration data and assessment work to be made available for inspection by the industry.

Alberta.—Alberta Government assistance to the mining industry is diversified in character. The Mines Division of the Department of Mines and Minerals regulates coal mines and quarries and maintains standards of safety by inspection and certification of workers. The Workmen's Compensation Board also maintains safety standards and pays the cost of training mine rescue crews. The oil and gas industries are served in a similar way by the Oil and Gas Conservation Board. Its regulatory measures, however, are also concerned with preventing the waste of oil and gas resources and with giving each owner of oil and gas rights the opportunity of obtaining a fair share of production. This Board compiles periodic reports and annual records which are of invaluable assistance in oil development in Alberta. The mining industry is also served by the Research Council of Alberta which has made geological surveys of most of the province and has carried forward projects concerned with the uses and development of minerals. The Council has studied the occurrence, uses and analyses of Alberta coals and their particular chemical and physical properties, the use of coals in the generation of power, and the upgrading and cleaning of coal, and has also studied briquetting, blending, abrasion loss, shatter and crushing strength, asphalt binders and dust-proofing of coal. Studies have been made of glass sands, salt, fertilizers, cement manufacture and brick and tile manufacture. (See also p. 496.)

The province from time to time has had commissions examine various aspects of the mining industry when it has considered that their findings would be of assistance in developing such industries. The province, together with the Canadian Association of Oil Well Drilling Contractors and the Canadian Petroleum Association, maintains a detailed supervisory and safety training program concerned with the drilling of oil and gas wells. Of

assistance also to mining companies and oil companies are the special reductions provided for in the Alberta Income Tax Act. These follow the parallel provisions in the federal Income Tax Act.

British Columbia.—The Department of Mines and Petroleum Resources of British Columbia provides the following services: detailed geological mapping as a supplement to the work of the Geological Survey of Canada; free assaying and analytical work for prospectors registered with the Department; assistance to the prospector in the field by departmental engineers and geologists; grub-stakes, limited to a maximum of \$800, for prospectors; assistance in the construction of mining roads and trails; and inspection of mines to ensure safe operating conditions.

Section 3.—Mining Legislation

Federal Mining Laws and Regulations.—As of Jan. 1, 1968, the mineral rights vested in the Crown in right of Canada are those situated in the Yukon Territory and the Northwest Territories, those in the islands of Hudson Bay and under Hudson Bay and Hudson Strait, and those under Canada's continental shelves. The Supreme Court of Canada in a recent decision made it clear that, as between Canada and the Province of British Columbia, the Crown in right of Canada owns and has legislative jurisdiction over "lands, including mines and minerals and other natural resources, of the sea bed and subsoil seaward from the ordinary low-water mark on the coast of the mainland and the several islands of British Columbia, outside the harbours, bays, estuaries and other similar inland waters to the outer limits of the territorial sea of Canada, as defined in the Territorial Sea and Fishing Zones Act. . .". The Court also decided that the Federal Government owns and has legislative jurisdiction "in respect of the mineral and other natural resources of the sea bed and subsoil beyond that part of the territorial sea of Canada . . . to a depth of 200 meters or, beyond that limit, to where the depth of the superjacent waters admits of the exploitation of the minerals and other natural resources of the said area".

In addition, the mineral rights of some small and usually isolated areas scattered throughout the provinces are vested in the Crown in the right of Canada. The Department of Energy, Mines and Resources is responsible for the disposition of mineral rights and for the administration and enforcement of regulations relating to minerals in Canada's offshore areas, other than those under Arctic coastal waters, in Hudson Bay, the islands in Hudson Bay, Hudson Strait and the small parcels above mentioned. The Department of Indian Affairs and Northern Development is similarly responsible in the Yukon Territory, the Northwest Territories and the offshore rights under Arctic coastal waters; this Department also acts as adviser to Indian bands in Indian reserves and is responsible for the administration and enforcement of the relevant regulations.

Mineral rights of Indian reserves in the provinces are also vested in the Crown in the right of Canada and are administered by the Indian Affairs Branch of the Department of Indian Affairs and Northern Development. The minerals on an Indian reserve may be developed under the Indian Oil and Gas Regulations or the Indian Mining Regulations for the benefit of the band of Indians having rights to the reserve, only after the band has given approval by referendum. Indian band councils are encouraged to take a share of responsibility in the management of their mineral resources.

Mining exploration is carried out in the Yukon Territory in accordance with the provisions of the Yukon Quartz Mining Act and the Yukon Placer Mining Act; in the Northwest Territories, including Arctic coastal waters, operations are governed by the Canada Mining Regulations 1961, as amended. There are also the Territorial Dredging Regulations, Territorial Coal Regulations and Territorial Quarrying Regulations common to both territories. In the Yukon Territory, mining rights may be acquired by staking

claims under the appropriate Acts or Regulations. A one-year lease may be obtained to prospect for the purposes of placer mining, renewable for two additional periods of one year each; a 21-year lease, renewable for a like period, may be obtained under the Yukon Quartz Mining Act.

Under the Canada Mining Regulations, a prospector's licence is required. Staked claims must be converted to lease or relinquished within ten years. In certain areas, a system of exploration by permit over large areas is allowed. Any individual over 18 years of age or any joint-stock company incorporated or licensed to do business in Canada may hold a prospector's licence. No lease will be granted to an individual unless the Minister of the Department involved is satisfied that the applicant is a Canadian citizen and will be the beneficial owner of any interest acquired under such lease; no lease will be granted to a corporation unless such corporation is incorporated in Canada and registered under Part VII of the Companies Ordinance (ONWT 1968, c. 1) and unless the Minister is satisfied that at least 50 p.c. of the issued shares of the corporation are owned by Canadian citizens or that the shares of the corporation are listed on a recognized Canadian stock exchange and that Canadians will have the opportunity of participating in the financing and ownership of the corporation. Any new mine beginning production after the Canada Mining Regulations came into force in 1961 will not be required to pay royalties for a period of 36 months, starting from the day the mine comes into production. Production date is established as the date determined under the provisions of the Income Tax Act.

An exploration assistance fund for petroleum and other minerals in the Yukon and Northwest Territories was established by the Federal Government in 1966. Initially limited to \$3,000,000 a year, the fund may provide 40 p.c. of the cost of approved exploration programs. Assistance is available only to Canadian citizens or companies incorporated in Canada. Named the Northern Mineral Exploration Program, it is designed to encourage investment from additional Canadian sources previously not attracted to investment in northern exploration operations.

Oil and Gas Legislation.—The Canada Oil and Gas Land Regulations and the Canada Oil and Gas Drilling and Production Regulations, issued pursuant to the Territorial Lands Act and the Public Lands Grants Act, regulate the disposition of oil and gas rights and regulate exploration and development in the Yukon Territory, the Northwest Territories and the offshore areas of the continental shelves, but not under lands within any provinces. Only subsurface rights and those beneath the sea bed are granted. When required, surface rights are negotiated separately. An exploratory permit may be granted and such permit issued on or after Jan. 1, 1968, depending on the area covered thereby, is valid for a term of three, four or six years; a permit is renewable for one-year periods up to six times by the Chief of the Resources Management Division, Resource and Economic Group, Department of Indian Affairs and Northern Development, and further renewals may be granted by the Minister. Leases, which are renewable if oil or gas is still able to be produced, must conform to prescribed land patterns but must not exceed 50 p.c. of the area of an exploratory permit area.

An oil and gas exploratory permit may be issued to any individual over 21 years of age or to any joint-stock company incorporated or licensed to do business in Canada, or incorporated in any province of Canada. Extraterritorial companies applying for permits in the Northwest Territories must be registered under Part VII of the Companies Ordinance. No oil and gas lease granted to a permittee will be issued to an individual unless the Minister of the Department involved is satisfied that the applicant is a Canadian citizen and will be the beneficial owner of any interest acquired under such lease, or to a corporation unless the Minister is satisfied that at least 50 p.c. of the issued shares of the corporation are beneficially owned by persons who are Canadian citizens or that the shares of the corporation are listed on a recognized Canadian stock exchange, and that Canadians will have an opportunity of participating in the financing and ownership of the corporation.

The Oil and Gas Production and Conservation Act (SC 1969, c. 48), given Royal Assent on June 27, 1969, applied to lands in the Yukon and Northwest Territories; a 1970 amendment (SC 1969-70, c. 43) extends the provisions of the Act to oil and gas in areas beyond the Territories that do not lie within the geographical or administrative control of any of the provinces. An Oil and Gas Committee of five members appointed by the Governor in Council is empowered to hold enquiries, to hear appeals, and to make orders in connection therewith.

Provincial Mining Laws and Regulations.*—In general, all Crown mineral lands lying within the boundaries of the several provinces (with the exception of those within Indian reserves, national parks and other lands which are under the jurisdiction of the Federal Government) are administered by the respective provincial governments. The exception is Quebec where all mineral lands except those granted to individuals in the townships prior to 1880 are administered by the province; also, mining rights on federal lands in Quebec are administered by the province.

The granting of land in any province except Ontario no longer automatically carries with it mining rights upon or under such land. In Ontario, mineral rights are expressly reserved if they are not to be included. In Nova Scotia, no mineral rights belong to the owner of the land except those pertaining to gypsum, agricultural limestone and building materials, and the Lieutenant-Governor in Council may declare deposits of either limestone or building materials to be minerals. Such declaration is to be based on economic value or to serve the public interest. In such case, the initial privilege of acquiring the declared minerals lies with the owner of the surface rights who must then conform with the requirements of the Mines Act. In Newfoundland, mineral and quarry rights are expressly reserved. Some early grants in British Columbia, Alberta, Saskatchewan, Manitoba, New Brunswick, Quebec and Newfoundland also included certain mineral rights. Otherwise, mining rights must be obtained separately by lease or grant from the provincial authority administering the mining laws and regulations. Mining activities may be classified as placer, general minerals (or veined minerals and bedded minerals), fuels (coal, petroleum and gas) and quarrying. Provincial mining regulations under these divisions are summarized in the following paragraphs.

Placer.—In most provinces in which placer deposits occur there are regulations defining the size of placer holdings, the terms under which they may be acquired and held, and the royalties to be paid.

General Minerals.—These minerals are sometimes described as quartz, lode, or minerals in place. With the exception of British Columbia, the most elaborate laws and regulations apply in this division. In all provinces except Alberta and Saskatchewan, a prospector's or miner's licence, valid for one year, must be obtained to search for mineral deposits, the licence being general in some areas but limited in others; a claim of promising ground of a specified size may then be staked. In Manitoba and British Columbia a licence is required only for staking and any number of dispositions may be staked under one licence. A claim must be recorded within a time limit and payment of recording fees made, except in Quebec where no fees are required. Work to a specified value per annum must be performed upon the claim for a period of up to ten years except in Quebec where a development licence may be renewed on a yearly basis; also in Manitoba and Saskatchewan there is no work commitment in the first year of the claim. There is no time limit in British Columbia but \$500 assessment work, of which a survey may represent two fifths, must be performed and recorded before a lease may be obtained. In Quebec, a specified number of man-hours of work must be performed and the excess may be carried forward for renewal of licence. The taxation applied most frequently is a percentage of net profits of producing mines or royalties. In Saskatchewan, subsurface mineral regulations covering non-metallics stipu-

* Compiled from material supplied by the provincial governments.

late the size and type of dispositions that may be made in order to maintain the disposition in good standing, provide for fees, rentals and royalties, and set out generally the rights and obligations of the disposition holder.

Fuels.—In provinces where coal occurs, the size of holdings is laid down together with the conditions of work and rental under which they may be held. In Quebec, the search for and development of petroleum and natural gas may be carried out under a prospecting or search permit followed by a working lease; the search permit covers a period of five years and an acreage of not over 60,000 acres, whereas the lease extends over a 20-year period and an acreage not over half the acreage of the permit. In Nova Scotia, mining rights to certain minerals, including petroleum, occurring under differing conditions may be held by different licensees. Provision is sometimes made for royalties. Acts or regulations govern methods of production. In the search for petroleum and natural gas, an exploration permit or reservation is usually required; however, in Manitoba, Saskatchewan, Alberta and British Columbia leases usually follow the exploration reservation whether or not any discovery of oil or gas is made. In Alberta, exploration costs are applicable in part on the first year's lease rental, in Manitoba they may be applied to the lease rental for a period of up to three years and, in British Columbia and Saskatchewan, credit is given for up to 24 months' rental, having regard to the amount of excess credit established. In other provinces, the discovery of oil or gas is usually prerequisite to obtaining a lease or grant of a limited area, subject to carrying out drilling obligations and paying a rental, a fee, or a royalty on production.

Quarrying.—Regulations under this heading define the size of holdings and the terms of lease or grant. In Nova Scotia, sand deposits of a quality suitable for uses other than building purposes and limestone deposits of metallurgical grade belong to the Crown; gypsum quarries belong to the owner of the property. Under the New Brunswick Quarriable Substances Act, 1968, quarriable substances (ordinary stone, building and construction stone, sand, gravel, peat and peat moss) are vested in the owner of the land in or on which they lie; the Minister with the approval of the Lieutenant-Governor in Council may designate a shore area lying outside Crown land to be subject to the Act; and no person shall take or remove or cause to be taken or removed more than one half cubic yard of a quarriable substance from Crown land or a designated shore area without obtaining a permit or lease. On Quebec public lands and on those granted to individuals after Jan. 1, 1966, the stone, sand and gravel, like other building materials, belong to the Crown; quarries located on land granted to individuals prior to 1966 remain in the possession of the owners of the surface; the right to exploit all building materials except sand and gravel may be acquired by ordinary staking-out and the right to work sand and gravel beds is set by regulation. In Saskatchewan, sand and gravel on the surface and all sand and gravel obtainable by stripping off the overburden or other surface operation belong to the owner of the surface of the land. In Alberta, sand, gravel, clay and marl recovered by excavating from the surface belong to the owner of the surface of the land.

Copies of mining legislation including regulations and other details may be obtained from the provincial authorities concerned.

Section 4.—World Production of Certain Metallic Minerals and Fuels

Table 33 shows the production of certain metallic minerals and fuels in the different countries of the world for the year 1968. These figures are taken from the *United Nations Statistical Yearbook 1969* which presents production figures for a much more extensive list of mining and quarrying industries.

33.—World Production of Certain Metallic Minerals and Fuels, 1968

NOTE.—Where dashes occur throughout this table they indicate that no figures were given in the *United Nations Statistical Yearbook* either because there was no production or because the quantity was not available.

Section 1.—Electric Power Development

Subsection 1.—Historical and Current Trends in Power Development

Electric power development in Canada has undergone remarkable and sustained growth since the beginning of the century. From a modest 133,000 kilowatts of generating capacity installed at the end of 1900, Canada's installed hydro capacity rose to 27,114,000 kw. by the end of 1969 and thermal capacity to almost 12,724,000 kw.

The facing chart shows the expansion in installed generating capacity in hydro and thermal stations that has taken place since 1920. Thermal-electric power development in Canada was not well documented early in the century but it is apparent that its growth was slow and of relatively minor importance until the late 1940s. The rate of development of hydro facilities, on the other hand, tended to accelerate after the turn of the century when improvements in electric power transmission techniques were introduced and increasing emphasis began to be placed on the construction of large hydro-electric stations.

During the prosperous 1920s, demand for electricity became heavier and the rate of installation increased appreciably. Then, under the depressed conditions of the early 1930s, power demand dropped off but did not show up immediately as a drop in the installation rate because of the time lag inherent in hydro-electric power development. The completion of hydro projects initiated prior to the depression period accounted for the continuation of a high rate of capacity installation up until 1935; thereafter, poor economic conditions in the 1935-39 period resulted in a reduced rate.

In the early war years, the tremendous demand for power to drive Canada's war industries accounted for the sharp rise in installation of new generating facilities between 1940 and 1943, but in the later war years construction dropped off so that, from 1944 to 1947, a second flattening occurred in the growth curve. After the War, industrial expansion and rapidly growing residential and agricultural development placed extremely

* Sections 1 and 2 of this Chapter were prepared by the Department of Energy, Mines and Resources, Ottawa; Sections 3 and 4 were revised by the Energy Statistics Section, Industry Division, Dominion Bureau of Statistics, and Section 5 by the various provincial Commissions concerned.

The main dam area of Ontario Hydro's Lower Notch Generating Station. This project will come into service in 1971 and is the fourth to tap the power potential of the Montreal River which flows southeastward into Lake Timiskaming.

heavy demands on power generating facilities. To stay abreast of these demands required the installation of new capacity at a rate higher than at any time in Canada's history. These demands also led to the start of an extensive program of thermal plant construction in the early 1950s, since they could not be satisfied from hydro sources alone. In 1956, thermal generation represented 14 p.c. of installed capacity. Since then, the annual installed capacity has averaged 57 p.c. hydro-electric and the remainder in thermal generation with the result that at the beginning of 1970 thermal generation accounted for 32 p.c. of Canada's installed capacity.

Table 1 shows the status of installed generating capacity in hydro and thermal stations and the combined total for all stations as at Jan. 1, 1970.

Current Trends.—Although water power traditionally has been and still is the main source of electric energy in Canada, thermal sources some day will undoubtedly become the main supplier. The choice between development of a hydro-electric power site and construction of a thermal generating station must take into account a number of complex considerations, the most important of which are economic in nature. In the case of a hydro-electric project, the heavy capital costs involved in construction are offset by maintenance and operating costs considerably lower than those for a thermal plant. The long life of a hydro plant and the dependability and flexibility of operation in meeting varying loads are added advantages. Also important is the fact that water is a renewable resource. The thermal station, on the other hand, can be located close to the demand area, with a consequent saving in transmission costs. With the current trend to large steam stations, however, a certain amount of the flexibility of location of thermal stations is lost because such units require considerable quantities of water for cooling purposes, making it essential that they be sited close to an adequate water supply.

The marked trend to thermal development which became apparent in the 1950s can be explained in part by the fact that, by that time in many parts of Canada, most of the hydro-electric sites within economic transmission distance of load centres had been developed and planners had to turn to other sources of electric energy. More recently, however, advances in extra-high-voltage transmission techniques are providing a renewed impetus to the development of hydro power sites previously considered too remote.

Because of the relatively long starting-up time required by large thermal units, thermal stations tend to lack flexibility of operation and can be used most efficiently to meet con-

tinuous load conditions. Hydro stations, on the other hand, can put generating units on line with minimum delay and hence are admirably suited to supply power to meet the peak loads which may occur several times each day. By combining the advantages of both hydro and thermal stations in integrated supply systems, power producers are now achieving much greater flexibility of operation.

Thermal power generation may use fossil fuels or nuclear fuels as the sources of energy. The fossil fuels—coal, gas or oil—can be obtained economically from domestic sources in some parts of Canada. In other regions the cost of transportation leads to the use of imported fossil fuels. Nuclear fuels are providing an increasingly important source of energy for thermal power plants and will be especially attractive for those regions where fossil fuel costs are relatively high and where the power system permits the use of very large generating units which show the best economic advantage for nuclear plants. The CANDU reactor system, which is providing the heat source for Canadian nuclear plants, allows the use of natural uranium mined and processed in Canada.

Another trend in development designed to meet the problem of varying daily loads is the use of pumped storage. An example is the Sir Adam Beck hydro development at Niagara Falls where water taken from the Niagara River above the Falls is carried by tunnel and power canal to penstocks which supply the main generating station on the bank of the Niagara River some distance below the Falls. In off-peak hours, power from the main station is used to pump water from the power canal into a reservoir maintained at a higher level; during peak-load hours, the pumps, which are dual-purpose units, operate as generators and are driven by water released from the reservoir. The pumping-generating units at this development make available an extra 176,700 kw. of generating capacity. A pumping-generating station using the same general principle has been constructed on the Brazeau River in Alberta as part of the 305,500-kw. Big Bend hydro development.

Perhaps the most promising application of the pumping-generating principle is its use in conjunction with nuclear power stations. Nuclear units, in common with the larger conventional thermal units, can be used most efficiently under conditions of continuous operation. Off-peak nuclear power can be used to operate pump-turbine units and the hydro-electric power derived from operating the units as generators is available for use during periods of peak demand.

Subsection 2.—Utilization of Power

In 1969, Canada's generating facilities produced a total of 190,093,000,000 kilowatt-hours of electric energy, after allowing for the energy used in the power stations themselves. Of this total, 77.8 p.c. was produced in hydro-electric stations and the remainder in thermal stations. Electric energy exported to the United States exceeded imports by 1,364,000,000 kwh. during 1969, so that the total energy made available in Canada amounted to 188,908,000,000 kwh.

Industry uses approximately 55 p.c. of the total electric energy made available in Canada; residential and farm use accounts for 21 p.c. and commercial use 15 p.c. The remaining 9 p.c. is listed under "losses and unaccounted for". Because many power producers do not distinguish in their records between residential and farm customers, the amount of energy used is combined. Energy used for street lighting represents less than 1 p.c. of the total energy made available and is included in the "commercial category".

About 20 p.c. of the total energy made available is used in the mineral industry, including smelting and refining, 16 p.c. by the pulp and paper industry and 19 p.c. by other industries. Of the latter, the chemical industry and the primary iron and steel industry together consume almost one half. Approximately 75 p.c. of the energy consumed by the mineral industry is used in the smelting and refining of metals.

The incidence of large water power resources in those regions in which the more important mineral deposits have been found has greatly facilitated mining development. Recent examples are the nickel mining and refining complex at Thompson, Man., which

uses hydro-electric power generated in the Kelsey plant on the Nelson River, and the iron ore mining operations in Labrador, supplied by the Twin Falls plant on the Unknown River. Metal mining, a very important division of the Canadian mining industry, is carried on mainly in two physiographic regions, the Western Cordillera and the Canadian Shield. In the Western Cordillera, the mountainous topography and the relatively high amounts of precipitation favour the development of water power. In the Canadian Shield, which is a Precambrian formation stretching in a wide sweep around Hudson Bay from the Mackenzie River basin to the eastern tip of Labrador, heavy glaciation in recent geological times has formed river systems which are comparatively young and are characterized by large numbers of lakes connected by short river sections with numerous rapids and falls suitable for the development of hydro-electric power.

Canada has no known deposits of bauxite but the availability of low-cost hydro-electric power has fostered the establishment of a large aluminum industry that produces one eighth of the world's supply of this metal, most of which is exported from Canada. Further evidence of the value of water power to mining operations is provided by the fact that Canada's asbestos industry, which produces about 35 p.c. of the world's supply of asbestos fibre, obtains the major part of its power supply from hydro-electric sources.

Canada's pulp and paper industry is one of the world's great industrial enterprises. Total mill capacity for the production of newsprint paper is considerably greater than that of any other country in the world, and in total production of wood pulp Canada is second only to the United States. The fact that about 90 p.c. of the manufactured newsprint is exported gives some indication of the importance of the industry to the Canadian economy. By far the larger portion of the energy used in the pulp and paper industry is derived from water power.

Subsection 3.—Water Power Resources, Undeveloped and Developed

Table 2 presents a summary of developed water power in Canada and an estimate of undeveloped water power potential, based on records maintained by the Inland Waters Branch of the Department of Energy, Mines and Resources. Estimates of available power are shown for undeveloped sites only; for developed sites, the total generating capacity actually installed is indicated. It should be noted that the capacity installed at an existing hydro-electric development is frequently in excess of the continuous power available at the site. The relationship between installation and available power is explained on p. 745.

2.—Water Power Resources, by Province, as at Jan. 1, 1969

¹ Power equivalent of flow available 95 p.c. of the time.
the time.

² Power equivalent of arithmetical mean flow.

³ Power equivalent of flow available 50 p.c. of

Undeveloped Water Power Resources.—Table 2 gives estimates of undeveloped power based on different rates of flow: the first column indicates continuous power ordinarily available during periods of low discharge under existing conditions of river flow based on Q95, which is the natural or modified flow available 95 p.c. of the time; the second column shows dependable maximum power based on Q50, which is the natural or modified flow available for at least 50 p.c. of the time; and the third column shows dependable maximum power based on Qm, the arithmetical mean flow. On rivers for which flow records are sparse or non-existent, estimates of flow are made from available information relating to run-off in the same general area. The hydraulic head used in calculating undeveloped water power is based on the actual drop or the feasible concentration of head which has been measured or carefully estimated. Preliminary figures for Quebec supplied by the provincial Department of Natural Resources, however, reflect the net river power potential which would result from development of the entire head available on Quebec rivers whose drainage areas exceed 3,000 sq. miles.

It should be emphasized that the figures of continuous power at Q95 represent only the minimum water power possibilities in Canada because estimates are based upon existing river flow and, for the most part, do not reflect the benefits of streamflow regulation that would result from the development of storage potential. Partial regulation is required in most instances to obtain the continuous power available at Q50. On the other hand, the arithmetical mean flow figures represent the power that would be obtainable if the entire flow in the river could be regulated to provide a continuous flow of constant magnitude. It can readily be seen that, because the latter condition assumes complete regulation, estimates of potential based upon arithmetical mean flow will, if other pertinent factors are neglected, exceed the amount of capacity that might be expected to be installed at the site, particularly where little or no storage is available. However, recent experience in the development of water power sites has indicated that, in fact, the generating capacities installed at many sites are very considerably in excess of what might be dictated by even the arithmetical mean flow. Several major river-diversion possibilities exist, particularly in British Columbia. For this reason, the estimates of potential of British Columbia's undeveloped hydro resources have recently been boosted substantially, mainly because of the inclusion of figures based upon the diversion of rivers which, if they are developed at all, will almost certainly be developed on a combined-river basis.

Developed Water Power Resources.—The figures of installed generating capacity given in Table 2 are based on the manufacturer's rating in kilowatts as shown on the generator name-plate, or derived from the rating where it is indicated in kilovolt-amperes. The maximum economic installation at a power site can be determined only by careful consideration of all the conditions and circumstances pertinent to its individual development. It is usual practice, however, to install units having a combined capacity in excess of the available continuous power at Q50, and frequently in excess of the power available at Qm. There are a number of reasons for this. The excess capacity may be installed for use at peak-load periods, to take advantage of periods of high flow, or to facilitate plant or system maintenance. In some instances, storage dams have been built subsequent to initial development to smooth out fluctuations in river flows. In other cases, deficiencies in power output during periods of low flow have been offset by auxiliary power supplied from thermal plants, or by interconnection with other plants which operate under different load conditions or are located on rivers with different flow characteristics.

Thus, the extent to which the installed capacity exceeds the available continuous power at the various rates of flow is dependent upon the factors that govern the system of plant operation, and varies widely in different areas of the country. In some developments, the difference may amount to several hundred per cent. For this reason, discretion should be used in comparing the figures in the last column with those in the preceding columns, as available continuous power and installed capacity are not directly

comparable. As a rough guide, however, it may be assumed that the power equivalent of the flow at Q50 represents an approximate, if conservative, estimate of hydro generating capacity remaining to be installed in Canada.

Provincial and Territorial Distribution.—The provincial and territorial distribution of undeveloped water power resources and installed generating capacity, given in Table 2, reveals that substantial amounts of water power have been developed in all provinces except Prince Edward Island, where water power resources are meagre. As natural resource development proceeds, the fortunate incidence of water power in proximity to mineral, forest and other resources becomes increasingly apparent. There is little doubt that the existence of large amounts of potential hydro power on northern rivers will prove to be a factor of prime importance in the eventual realization of the natural wealth of Canada's North.

The water power resources of *Newfoundland*, determined on the basis of the limited available streamflow data, are estimated to be of very considerable magnitude. On the Island, although the length of the rivers is generally not great, topography and run-off are favourable for hydro-electric power development. Of the substantial capacity installed, a very large portion serves the pulp and paper industry. In Labrador, the Churchill River and its tributaries, now under development, constitute one of the largest potential sources of water power in Canada.

In *Prince Edward Island* there are no large streams and water power plants are limited in size to those used to operate small mills. The water power resources of *Nova Scotia* and *New Brunswick*, although small in comparison with those of other provinces, are a valuable source of energy and make a substantial contribution to the economies of the two provinces. Numerous rivers in both provinces provide moderate-sized power sites either within economic transmission distance of the principal cities and towns or advantageously situated for use in development of the timber and mineral resources. These provinces are also favoured with abundant indigenous coal supplies.

Quebec is the richest of all the provinces in water power resources, possessing more than 40 p.c. of the total recorded for Canada. Quebec also leads in developed water power, its installation of 12,499,000 kw. in 1970 representing about 46 p.c. of the national total. Notable developments are the Quebec Hydro-Electric Commission's 1,574,260-kw. Beauharnois development on the St. Lawrence River, the Commission's 1,015,200-kw. Manic 2 development on the Manicouagan River, and its Bersimis I development on the Bersimis River having an installed capacity of 912,000 kw.; the Aluminum Company of Canada Limited owns the 742,500-kw. Chute des Passes plant on the Peribonca River. The Manic 2 development is part of a major power project which represents a significant advance in the development of Quebec's hydro-electric resources. This project, involving the harnessing of the headwaters of the Manicouagan and Outardes Rivers, will permit the eventual installation of some 5,540,000 kw. on the two rivers; a total installation of 2,942,000 kw. was in service at the beginning of 1970. Power production in the province is facilitated by the regulation of streamflow by the provincial Department of Natural Resources through the storage dams which it owns and operates. Some of the responsibility for regulation rests with the Quebec Hydro-Electric Commission.

Almost all of the sizable water power potential in *Ontario* within easy reach of demand centres has been developed and planners are looking to the more remote sites as new sources of supply. Improvements in long-distance transmission techniques have brought many of these sites within the economic orbit of demand centres. Several sites are being developed and a number of others are under investigation. Most of the hydro-electric power produced in the province comes from the generators of The Hydro-Electric Power Commission of Ontario, Canada's largest power producing and distributing organization. Ontario's largest hydro-electric generating station is located on the Niagara River at Queenston, where the Sir Adam Beck-Niagara Generating Stations Nos. 1 and 2 and the associated pumping-generating station have a combined generating capacity of 1,804,200 kw.

In addition to the power generated in its own plants, the Commission purchased electric power generated outside the province to the extent of 6 p.c. of its total requirements in 1969.

Of the three Prairie Provinces, *Manitoba*, with immense hydro-electric capabilities on the Winnipeg, Churchill, Nelson and Saskatchewan Rivers, is the most generously endowed with water power resources. Until recently, hydro-electric generating stations on the Winnipeg River supplied most of the power requirements of southern Manitoba. Manitoba Hydro's high-voltage, long-distance transmission lines, however, will carry ever-increasing amounts of power south from hydro-electric stations on northern rivers to help meet the province's constantly growing power demands. Of particular interest is the initial development of the Nelson River System. The Kettle Rapids site is being developed toward an ultimate capacity of 1,219,200 kw. and power will be transmitted over a 556-mile high-voltage direct current transmission system at ± 450 kilovolts to a receiving station near Winnipeg. Large water power resources exist in the central and northern parts of *Saskatchewan*, principally on the Churchill, Fond du Lac, and Saskatchewan Rivers. Power from Squaw Rapids on the Saskatchewan River is fed into the transmission network of the provincially owned Saskatchewan Power Corporation, which serves the more settled areas of the province. Before the completion of this development in 1963, these areas had been served by electric power from thermal plants fuelled by coal, oil or natural gas, the hydro-electric power generated in the province being used almost exclusively for mining purposes in northern areas. In *Alberta*, most of the principal hydro-electric developments are located on the Bow River and its tributaries and, from these developments, Calgary Power Ltd. serves most of the southern part of the province. The Big Bend hydro-electric development on the Brazeau River in the headwaters of the North Saskatchewan River, completed in 1967, augmented the energy from the Bow River plants and another development on that river at Bighorn will add 108,000 kw. in 1972. Substantial water power resources are located in the northern regions and, although these are somewhat remote from present centres of population, the advent of extra-high-voltage transmission has enhanced the prospect of their development.

British Columbia has many mountain streams that offer abundant opportunity for the development of hydro-electric power. In terms of recorded available water power resources, developed and undeveloped, the province ranks second in Canada and is exceeded only by Quebec and Ontario in the amount of generating capacity installed. Notable for the magnitude of their power potential are such rivers as the Columbia, the Fraser, the Peace and the Stikine. Until recently, however, hydro-electric developments on smaller rivers in the southern areas have satisfied the major load requirements of the province but in 1968 the immense power resources of the Peace River began to supplement the energy supply. Development of the hydro potential of the Canadian portion of the Columbia River is being planned, utilizing the water stored behind three huge storage reservoirs, two of which have been completed. The foremost producer and distributor of electric power in British Columbia is the provincially owned British Columbia Hydro and Power Authority.

Power from present developments in the *Yukon Territory* and the *Northwest Territories* is used largely to satisfy the needs of local mines and adjacent settlements. To date, fossil fuel resources have not provided any significant contribution to electric power supply. The Northern Canada Power Commission is authorized to construct and manage public utility plants in both Territories. In the Yukon Territory, most of the resources are located on the Yukon River and its tributaries, and these represent some of the largest undeveloped hydro-electric resources in North America. In addition to developments within the Upper Yukon River basin, there are attractive development opportunities being explored which involve the diversion of some of the headwaters of the Yukon River through the Coast Mountains to tidewater. Other hydro-electric resources in the Territories have been reviewed to establish an inventory of available developments which include, in addition to sites on the Yukon River tributaries, potential developments on the Lockhart and Coppermine Rivers. The South Nahanni River also has a significant development potential.

Subsection 4.—Thermal Power Generation

The incidence of immense water power resources in Canada and the brisk pace of their development has tended to overshadow the very considerable contribution being made by thermal energy in the nation's power economy. At the end of 1969, the total installed thermal capacity in Canada was 12,724,000 kw., about 32 p.c. of the total electric generating capacity in the country. The fact that energy produced in thermal plants during the year accounted for only 22 p.c. of the total may be attributed in part to the fact that a considerable amount of the capacity installed is operated for peak-load duty, with hydro-electric capacity providing base load generation. This pattern will change with the introduction of additional nuclear-fuelled thermal generation plants which can be operated economically at high capacity factors for base load purposes.

Conventional Thermal Power.—Over 90 p.c. of all thermal power generating equipment in Canada is driven by steam turbines. The magnitude of the loads being carried by steam plants has led to the installation of steam units with capacities as high as 500,000 kw. The remainder of the load is carried by gas turbine and internal combustion equipment. The flexibility of internal combustion engines makes this type of equipment particularly suitable for meeting power loads in smaller centres, especially in the more isolated areas.

Table 1, p. 742, shows that thermal generation is predominant in Prince Edward Island and Nova Scotia, and also that in Alberta, Saskatchewan and New Brunswick more than half of the installed capacity is thermal. Ontario still had more hydro than thermal capacity at the beginning of 1970 but this situation will be reversed by the end of the year, and thereafter thermal generation will be predominant in that province.

Thermal capacity in Newfoundland has, to date, consisted of smaller internal combustion stations serving more isolated communities together with a few medium-sized gas turbine and steam turbine units in larger centres. Construction of the province's first thermal station at Holyrood is to be completed in 1970; its two 150,000-kw. steam units will be fuelled by residual oil from a nearby refinery. Although coal is still the most important fossil fuel for thermal plants in Nova Scotia, oil is rapidly becoming the preferred choice for thermal power generation in all of the Atlantic Provinces.

The abundance of Quebec's water power wealth, much of it within economic transmission distance of existing demand areas, has so far limited the application of thermal power to specific local use. However, the growing emphasis on thermal power in other parts of Canada is also beginning to be apparent in Quebec, where thermal capacity will serve not only to help guarantee an adequate power supply in the face of increasingly heavy demands but also to render the almost exclusively hydro-electric base more flexible through integrated operation. Quebec's largest thermal plant, the Tracy Station near Sorel, has an installed capacity of 600,000 kw.

Ontario has more thermal capacity than any other province in Canada; capacity installed at the beginning of 1970 was 5,880,000 kw., which was about 46 p.c. of the national total. Ontario Hydro's Lakeview station at Toronto is Canada's largest thermal generating station, having an installed capacity of 2,430,000 kw. The Lambton station near Sarnia will reach its designed capacity of 2,000,000 kw. in 1970. Two more thermal stations are planned with final capacities of 4,000,000 kw. (at Nanticoke near Port Dover) and 2,295,000 kw. (at Lennox, west of Kingston). With the exception of Lennox which will use oil fuel, Ontario's fossil-fuelled thermal power plants are designed to be coal-fired.

Manitoba supplements its predominantly hydro-based power supply with a substantial amount of thermal capacity but current emphasis is on development of water power resources. Saskatchewan, until recently, relied on thermal capacity to satisfy the needs of the more settled areas and hydro-electric power generated in the province was used almost exclusively for mining purposes in the northern areas. In the past few years, however, development of storage on the Saskatchewan River has made hydro-electric power

from Squaw Rapids and Coteau Creek available in the southern part of the province. Thermal generation will provide the next stage of expansion with extensions under way at Boundary Dam (Estevan) and Queen Elizabeth (Saskatoon) stations. The incidence of vast fuel resources accounts for the emphasis on thermal power generation in Alberta; the province's largest thermal plants are the 405,000-kw. gas turbine and steam station at Edmonton and the 582,000-kw. Wabamun steam station. Planned expansion includes a 300,000-kw. unit at Sundance (near Wabamun) and two 165,000-kw. units at Clover Bar (near Edmonton).

About two thirds of British Columbia's thermal generating capacity is installed in three plants located in the Vancouver area. The capacity of the largest of these plants, the Burrard generating station, is 750,000 kw.

Until 1965, most of the power requirements of the Northwest Territories were satisfied from thermal sources but the commissioning of the Twin Gorges hydro station on the Taltson River in that year altered the balance in favour of hydro. In Yukon Territory, hydro is the larger contributor. Virtually all of the thermal-electric energy in the Territories is generated by small diesel units.

Nuclear Thermal Power.—Commercial electric power generated from the heat of nuclear reaction became a reality in Canada in 1962 when the 20,000-kw. (electricity) Nuclear Power Demonstration station at Rolphton, Ont., fed power for the first time into a distribution system in Ontario. The NPD station is the forerunner in a series of large nuclear stations that will shoulder more and more of Canada's rapidly growing power loads.

Research into reactor design and the application of nuclear energy in the electric power field are among the more important responsibilities of Atomic Energy of Canada

Gentilly nuclear station, located on the south bank of the St. Lawrence River mid-way between Montreal and Quebec City, is scheduled to begin generating electricity in 1971. It is owned by Atomic Energy of Canada Limited, the Canadian Government nuclear agency, and will be operated, and eventually purchased, by Hydro-Quebec.

Limited, a Crown company incorporated in 1952 (see also pp. 480-487). AECL has concentrated its efforts on the development of the CANDU reactor, which uses natural uranium as a fuel and heavy water as the moderator. By using heavy water as the moderator, a high energy yield can be obtained from natural uranium and, since natural uranium is a low-cost nuclear fuel, the cost of fuel is a minor component in the cost of producing power. Natural uranium has the added attraction of being available in commercial quantities in Canada.

The NPD station has been used extensively to demonstrate the ability of the system to operate at a high capacity factor and to determine the nature and predictability of outages. Fuel changes while the system is in operation have become routine and a considerable amount of research into the sources of heavy water losses has been carried out. As a result of this research, losses have been cut down and the NPD station is demonstrating that a very acceptable heavy water loss rate is attainable. The station was modified in 1968 to a boiling heavy water mode of operation to provide additional demonstration capabilities.

At Douglas Point on the shore of Lake Huron, the country's first full-scale nuclear power station went into commercial production in 1967. The station, built with the co-operation of Ontario Hydro, houses a 200,000-kwe. CANDU reactor. Experience gained in the design and operation of this reactor has encouraged the development of even larger units and construction of the four-unit, 2,160,000-kwe. Pickering nuclear station is under way near Toronto, with in-service dates for the units scheduled for 1971 to 1974. Construction of the Bruce nuclear station for Ontario Hydro is under way with four 800,000-kwe. units planned for installation during 1975 to 1978.

A further step in the development of the CANDU reactor is the use of boiling light water instead of pressurized heavy water as the coolant. Quebec's Gentilly nuclear station being constructed near Trois-Rivières will utilize boiling light water in its CANDU reactor. This station is scheduled for service in 1971 with 250,000 kwe. of nuclear-electric capacity.

Subsection 5.—Electric Power Transmission

The nature of the loads handled by the small, widely scattered generating systems in the early days of the electric power industry in Canada did not warrant the expense of interconnecting power systems. However, as the demand for dependable electric power increased and improved techniques reduced power transmission costs, the benefits of integrating power systems to achieve reliability of service and flexibility of operation were re-appraised. Today, most of Canada's generating stations are components of large, integrated and often interconnected power systems operated by power utilities and companies in the various provinces.

Constant research in the field of power transmission has developed techniques that enable power producers to utilize hydro-electric sites previously considered beyond economic transmission distances. Most noticeable, perhaps, is the progressive stepping-up of transmission-line voltages. In Canada, there are a number of transmission lines designed for operation at 500,000 volts and 735,000 volts. A 574-mile, 500,000-volt line is in service to carry power from the Peace River to the lower mainland of British Columbia. In Ontario, a 435-mile, 500,000-volt line carries power from hydro-electric plants in the James Bay watershed to Toronto. In 1965, Hydro Quebec achieved world leadership when power was carried for the first time at 735,000 volts over the 375-mile transmission line between Quebec's Manicouagan-Outardes hydro complex and the cities of Quebec and Montreal.

Most power is transmitted with alternating current but three applications of high voltage direct current (HVDC) have been found in Canada. In service in British Columbia is a 260,000-volt HVDC link from the mainland to Vancouver Island. It has a capacity of 312,000 kw. and includes 21 miles of undersea cable; it is a monopolar system using the ground as the return path for current. A second HVDC system is expected to be placed in service in 1971 over two 555-mile lines from the Kettle generation station on the Nelson

River to Winnipeg. The initial capacity is 810,000 kw. and the planned ultimate rating is 3,600,000 kw. Another application is designed to provide a non-synchronous tie between the systems of New Brunswick and Quebec; this is a 320,000-kw. back-to-back HVDC system located at Eel River, N.B., which will be placed in service in 1972 and will employ solid state thyristor valves in place of the mercury arc valves used for the earlier HVDC systems.

Interconnections of from 66,000 to 230,000 volts exist between British Columbia and Alberta: Saskatchewan, Manitoba, Ontario and portions of the Quebec system are interconnected and, through the Ontario Hydro system, are linked with the northeastern United States systems; and Quebec, New Brunswick and Nova Scotia systems are interconnected. British Columbia has an international tie with the Pacific northwest (500,000 volts) and links with the United States are planned for Manitoba (230,000 volts) and between the New Brunswick and Maine systems (345,000 volts).

The search for economies in transmission systems has led to changes not only in materials used but also in tower erection and cable-stringing methods. Guyed V-shaped and Y-shaped transmission towers are being used increasingly in place of self-supporting towers where the terrain is suitable, and erection costs are being reduced by the use of helicopters to transport tower sections to the site for tower assembly. The use of helicopters for spraying in brush control on the right-of-way and for line inspection and maintenance is widespread.

Section 2.—Progress in Construction of Generating Facilities, 1969

Additions to electrical generating capacity in 1969 of 3,840,000 kw. raised the total installed capacity in Canada to 39,838,000 kw., an increase of 10.7 p.c. over 1968. This was a record year for generation addition, exceeding by 29 p.c. the 1968 figure of 2,968,000 kw. Of the 1969 additions, hydro-electric capacity accounted for 55 p.c., or 2,132,000 kw., and thermal generation for the remaining 1,708,000 kw., so that at the end of the year total installed capacity was 68 p.c. hydro electric and 32 p.c. thermal.

The trend to larger unit sizes is indicated by the fact that units of 150,000 kw. or greater accounted for 85 p.c. of the hydro-electric capacity increase in 1969 and for 83 p.c. of the thermal-electric plant additions.

Newfoundland.—Load growth in the Island of Newfoundland will be met by the addition of 153,000 kw. in two units to the Baie d'Espoir hydro plant in 1970 and the first of two 150,000-kw. oil-fired thermal units at Holyrood; the second Holyrood addition is scheduled for 1971. In 1969, transmission capacity was increased by the addition of 55 miles of 230-kv. line.

In Labrador, the tremendous development at Churchill Falls continued on schedule. First power is planned for 1971 and commercial delivery to Hydro Quebec over the 735-kv. transmission system for May 1972. A total of 5,225,000 kw. in 11 hydro generator units is scheduled to be placed in service by 1976. Studies are under way to determine the feasibility of further generation developments at sites on the river below Churchill Falls.

Prince Edward Island.—No major changes were made in Prince Edward Island in 1969. An additional 20,000 kw. of thermal capacity is scheduled for 1971.

Nova Scotia.—Thermal capacity totalling 230,000 kw. was added in 1969 by the Nova Scotia Power Commission, consisting of a 150,000-kw. extension at Trenton and an 80,000-kw. unit at Point Tupper; the latter will also supply steam to the nearby Canadian General Electric heavy water plant. Nova Scotia Light and Power will add a 105,000-kw. unit to Tufts Cove in 1971.

Transmission expansion in 1969 included 88 miles at 138 kv. An additional 132 miles is planned at this voltage, some of which will be suitable for up-rating to 230 kv.

New Brunswick.—The 100,000-kw. thermal generating unit at Dalhousie was the principal addition to plant capacity in 1969 in New Brunswick. Consideration is being given to additions to the Mactaquac hydro station and to extensions of thermal generating capacity.

Transmission expansion planning was very active in 1969. A 320,000-kw. back-to-back direct-current converter terminal was committed for Eel River to provide an interconnection with Hydro Quebec. The equipment will use solid state thyristors and is the first to involve converter valve equipment manufactured in Canada for a high-voltage DC system. The interconnection will facilitate the purchase from Quebec of a portion of Churchill Falls energy, surplus to Quebec's needs, in the period 1972-76 and subsequently allow for economic interchange to the benefit of both provinces.

An agreement was reached with a group of New England utilities for an interconnection which will permit New Brunswick to sell peaking power at advantageous terms. A 345-kv. transmission circuit is planned for this purpose and application has been made to the National Energy Board for an export permit.

Quebec.—Major additions in 1969 amounting to 1,388,000 kw. to the Manicouagan-Outardes development at Outardes 3 and 4, completed nearly 50 p.c. of the total planned generating capacity in this region. By 1972, when an additional 1,322,000 kw. at Manic 5 will be in operation, 70 p.c. of the final 5,540,000 kw. will have been completed. The most recently committed development of 1,176,000 kw. at Manic 3 is scheduled for operation in 1976. Much of Quebec's load growth in the period 1972-76 will be met from the Churchill Falls development under a long-term contract with Brinco. The nuclear plant at Gentilly will add 250,000 kwe. to the capability of the province in 1971.

Ontario.—The placing in service of the first two 500,000-kw. units at Lambton thermal station gave that station the distinction of having the largest unit size in Canada; it is the third largest thermal station in Canada after Lakeview and R. L. Hearn. By the end of 1970, the Lambton capacity will be doubled, making it second only to Lakeview. However, this is somewhat overshadowed by the announcement of future plans for thermal plant expansion in Ontario, which include four 800,000-kw. units at the Bruce nuclear station, four 500,000-kw. nuclear oil-fired units at Lennox near Kingston, and four additional coal-fired units at Nanticoke. These additions, when added to previously committed expansions of four 500,000-kw. units at Nanticoke and four 540,000-kwe. units at the Pickering nuclear station, will provide total expansion plans after 1970 of 11,745,000 kw. in fossil- and nuclear-fuelled capacity. Modest hydro expansion continues with somewhat over 200,000 kw. added in 1969 and scheduled for each of the years 1970 and 1971.

Transmission expansion in 1969 related primarily to the completion and strengthening of the 230-kv. interconnection between the eastern and western regions of the province; a total of 610 circuit miles of 230-kv. line was added.

Manitoba.—In 1969, a 105,000-kw. thermal unit was added at Brandon and two 12,000-kw. gas turbines were installed at the Selkirk station, increasing the province's thermal capability by 129,000 kw. A sixth 33,000-kw. generator unit at Kelsey on the Nelson River raised the capacity of this northern Manitoba hydro station to 202,500 kw. The AC transmission system was extended by 126 miles at 115 kv. and 106 miles at 66 kv. Planned expansion includes 140 miles at 138 kv. and 165 miles at 230 kv.

Major expansion plans centre on the Nelson River development, the first units of the Kettle plant being scheduled for 1971. Construction of the related 1,112 circuit miles of ± 450 -kv. high-voltage direct-current transmission is scheduled for completion in August 1971; the associated converter terminal equipment will provide 810,000 kw. of transmission capacity for the initial service date. Some uncertainty exists in connection with the long-term development of the Nelson River pending re-examination of various aspects of water diversion and storage pertaining to the Churchill River, Southern Indian Lake and Lake Winnipeg.

Saskatchewan.—In 1969 the first of three 150,000-kw. coal-fired thermal units planned for Boundary Dam was completed. The transmission system was reinforced by the addition of a 115-mile 230-kv. circuit and plans are under way to add 120 miles of 230-kv. line and upgrade 115 miles of existing 138-kv. circuit to operation at 230 kv.

Alberta.—The major addition during 1969 was a 150,000-kw. thermal unit at the Battle River plant of Canadian Utilities Limited. Plans include a 165,000-kw. unit in 1970 (Edmonton Power) and a second 300,000-kw. unit in 1971 at Sundance (Calgary Power). The next significant hydro-electric addition will be two 54,000-kw. units at Bighorn on the North Saskatchewan River (Calgary Power), scheduled for 1972. Transmission additions in the province in 1969 included 168 circuit miles at 144 kv.

British Columbia.—Two additional units rated at 227,000 kw. each were placed in service in the Gordon M. Shrum station on the Peace River and 781 miles of transmission line were added to the related 500-kv. AC transmission system. Construction of the Mica Dam under the Columbia River Treaty continued. Downstream power benefits were received during the year as a result of the early completion of the Hugh Keenleyside (Arrow Lakes) Dam in October 1968. The completion of 21 miles of undersea cable circuit and 26 miles of associated overhead line and the doubling of both voltage and current rating to 260 kv. and 1,200 amps., respectively, raised the transmission capacity of the DC transmission system to Vancouver Island from 78,000 kw. to 312,000 kw.; this is a monopolar system with ground return path.

Yukon Territory.—The first 138-kv. transmission line in the Yukon, a 250-mile single-circuit woodpole line, was placed in service in 1969 to supply power from Whitehorse to the Anvil Mining Corporation at Faro. An 8,000-kw. hydro-electric unit was added to the Whitehorse plant to meet, in part, this additional mining load.

Northwest Territories.—Most generating plant changes in the Northwest Territories in 1969 involved re-allocation of diesel units to suit local needs. Substantial additions will take place in 1970 to a number of generating stations when over 20,000 kw. in diesel plant capacity is to be added to the existing system total of 66,000 kw. installed.

Section 3.—Power Generating Capability and Load Requirements

Power generating *capability*, as covered in this Section, is the measurement of the available generating resources of all hydro and thermal facilities at the time of the one-hour firm peak load for each reporting company, and is not equal to the *capacity* of such generating facilities. For example, a hydro plant may have a capacity of 100,000 kw. but if, at the time of peak load, the water available for generation is only 80 p.c. of the plant capacity requirements, then its capability is 80,000 kw.

Total generating capability has grown at a rapid rate especially in the last few decades. The annual rate of increase was 6.4 p.c. in the ten-year period 1959-69 and 7.8 p.c. in the four-year period 1965-69. In comparison, the forecast rate of growth for the years 1969-74 is 7.5 p.c.; thermal generating capability is expected to grow at an average rate of 11.9 p.c. a year in the forecast period compared with 13.9 p.c. in the period 1959-69, and hydro-electric capability is expected to increase at 5.3 p.c. a year compared with 4.3 p.c. in the 1959-69 period. This rate of growth in hydro generating capability in the forecast period is attributable to the large power projects under construction in relatively remote areas that will be completed within the next few years.

Among the provinces, Quebec has the largest generating capability, followed by Ontario, British Columbia and Alberta. Quebec also has the largest hydro-electric generating capability, followed by Ontario and British Columbia, but Ontario has the largest thermal capability followed by Alberta and British Columbia. The first full-scale nuclear power station went into commercial operation in Ontario early in 1967.

The largest absolute growth in generating capability for the forecast years is indicated for Ontario at 6,377,000 kw., followed by Newfoundland at 3,680,000 kw.; Quebec at 1,716,000 kw. and British Columbia at 1,633,000 kw. Ontario will meet most of its increased generating capability by adding 5,927,000 kw. in thermal capability and 450,000 kw. in hydro capability, the former including 2,000,000 kw. nuclear. Newfoundland will add 3,373,000 kw. hydro and 307,000 kw. thermal and Quebec 1,486,000 kw. hydro and 230,000 kw. thermal.

Firm power peak load is the measure of the maximum average net kilowatt demand of one-hour duration from all loads, including commercial, residential, farm and industrial consumers as well as the line losses. Such load demand increased at the rate of 7.0 p.c. a year from 1959 to 1969 and 7.3 p.c. a year from 1964 to 1969; peak-load demand is forecast to increase at the average rate of 7.1 p.c. a year in the period 1969-74. As a result of the rapid increase in generating capability and the somewhat slower but steady increase in the peak loads, together with the slight reduction in deliveries of firm power to the United States, the indicated reserve on net generating capability in the 1959-69 period increased each year except 1961, 1963, 1964 and 1966. The forecast is for increases from 1969 to 1974 with the exception of 1970. The reserve ratio as a percentage of firm power peak load reached a high of 28.2 p.c. in 1960 and fell to 11.6 p.c. in 1966 but is expected to increase to 18.8 p.c. in 1974.

3.—Net Generating Capability, by Province, 1969

(Thousand kilowatts)

Province or Territory	Type of Generating Facility				Total
	Hydro-Electric	Thermal-Electric			
		Steam ¹	Internal Com-bustion	Gas Turbine	
Newfoundland.....	810	30	23	29	892
Prince Edward Island.....	—	67	7	—	74

¹ Includes 208,000 kw. of nuclear capability in Ontario.

Section 4.—Electric Power Statistics

Electric power statistics presented in this Section are based on reports of all electrical utilities and all industrial establishments that generate energy regardless of whether or not any is sold and therefore show the total production and distribution of electric energy in Canada. Utilities are defined as companies, commissions, municipalities or individuals whose primary function is to sell most of the electric energy that they have either generated or purchased. Industrial establishments are defined as companies or individuals that generate electricity mainly for use in their own plants.

4.—Capacity and Firm Power Peak-Load Requirements, Actual 1951 and 1962-69 and Forecast 1970-74
(Thousand kilowatts)

Item	Actual										Forecast

The current series of electric power statistics dates back to 1956. Earlier reports, entitled *Central Electric Stations*, were concerned solely with the electrical utility industry and hence excluded statistics relating to power produced by industrial establishments for their own use, although power sold by such establishments was included. The latest figures available at time of printing (February 1971) for Tables 6-10 were for 1968.

5.—Electric Energy Generated, by Type of Station, 1960-69, and by Province 1968 and 1969

Of the total generation in 1969 of 190,093,000,000 kwh., 77.8 p.c. was produced from water power and 22.2 p.c. was generated thermally; the proportions differed markedly among provinces as shown in the following statement.

Province	Hydro	Thermal	Province or Territory	Hydro	Thermal

Table 6 gives summary figures of power production and distribution classified by province, and Tables 7 and 8 give figures classified by type of production establishment. Total installed capacity in Canada amounted to 35,908,497 kw. in 1968, an increase of 2,943,130 kw. over 1967. Of the 1968 total, 30,599,012 kw. were accounted for by utilities and the remainder by industrial establishments. During 1967 and 1968, total sales to ultimate customers amounted to 107,762,063,000 kwh. and 116,795,097,000 kwh., respectively, of which 99.8 p.c. in both years was sold by utilities.

Sales to power customers excluding sales to industrial establishments with generating facilities made up 50.5 p.c. of the total in 1967 and 49.7 p.c. in 1968, sales to domestic and farm customers were 32.5 p.c. and 32.3 p.c., respectively, and commercial sales 15.9 p.c. and 16.8 p.c., respectively. Exports to the United States in 1968 amounted to 3,988,314,000 kwh., slightly less than in 1967.

Average domestic and farm consumption rose from 6,261 kwh. in 1967 to 6,571 kwh. in 1968. Among the provinces, the averages in 1968 varied from a low of 3,305 kwh. in Prince Edward Island to a high of 8,062 kwh. in Manitoba. For domestic and farm customers the average annual bill was \$97.52 in 1968 as against \$90.71 in 1967.

Although many utilities do not keep records on farm customers separate from other domestic customers, the data reported on farm service indicate that the average consumption rose from 8,548 kwh. per customer in 1967 to 9,155 kwh. in 1968 and the average bill from \$145.08 to \$156.26.

In 1968, natural gas accounted for 17.3 p.c. of thermal generation by utilities, coal for 61.4 p.c., petroleum fuels for 19.0 p.c. and nuclear fuel for 2.3 p.c.; corresponding proportions in 1967 were 18.9 p.c., 65.1 p.c., 15.5 p.c., and 0.5 p.c., respectively.

Section 5.—Electrical Utility Ownership and Regulation

Federal Government regulation of electrical utilities with respect to the export of electric power and the construction of lines over which such power is exported falls within the jurisdiction of the National Energy Board (see Index).

Power is generated in Canada by publicly and privately operated utilities and by industrial establishments. Table 8, p. 759, giving statistics by type of establishment shows that over 70 p.c. of the total electric power generated in 1968 was produced by publicly operated utilities, 10 p.c. by privately operated utilities and 18 p.c. by industrial establishments. However, ownership differs greatly in different areas of the country. Quebec output at one time was predominantly from privately owned plants but since 1963 has been almost entirely publicly owned. In Ontario almost all electric power has been produced by a publicly owned utility for over 60 years.

Because the determination of market prices and regulation of services is limited to inter-fuel competition with oil, gas and coal, some regulation of electrical utilities has been attempted in all provinces. In most of them the generation and main transmission of power is the responsibility of a provincial Crown corporation. Investor-owned electrical utilities are predominant in Alberta and play a significant role in Nova Scotia, Newfoundland, Prince Edward Island, Ontario and British Columbia; they contribute about 10 p.c. of the total power generated. Generating facilities in industrial establishments represented 13.2 p.c. of installed capacity at the end of 1969 and generated 17.6 p.c. of the electric energy produced during the year. There is an annual decline in industrial generation as it becomes increasingly attractive to purchase power from utilities which can take fuller advantage of larger unit sizes and operational flexibility. Even when process steam is required for an industrial operation, there are instances when it is advantageous to purchase both steam and power from the electrical utility; supply of steam to the Point Tupper heavy water plant from the Nova Scotia Power Commission Point Tupper thermal station, commissioned in 1969, is an example.

Newfoundland.—The Newfoundland and Labrador Power Commission was established by the provincial government in 1954 for the purpose of supplying power wherever needed throughout the province. The Commission began large-scale production of electric energy in 1967 when the Baie d'Espoir plant began operating and the provincial transmission grid was established. Prior to this, electricity was provided to isolated areas through the Rural Electricity Authority and Power Distribution Districts. The Newfoundland Light and Power Company is an investor-owned company serving the city of St. John's and a portion of the province beyond this urban area. In Labrador, the Churchill Falls (Labrador) Corporation, a subsidiary of Brinco, is engaged in the development of the massive Churchill Falls power project which will commence production in 1972. This company also controls the Twin Falls Power Corporation which operates a substantial generating plant in the vicinity of Churchill Falls on the Unknown River and serves iron ore mining centres in western Labrador.

Prince Edward Island.—The Maritime Electric Company provides service to customers in Charlottetown and in most of the towns, villages and rural areas in the province. The Company, having total assets of \$29,608,082, supplied 21,893,000 kwh. in 1969, an increase of 9.9 p.c. over 1968, and had an installed capacity of 70,500 kw. The town of Summerside is supplied by a municipal electric department with an installed generating capacity of 6,900 kw. It is interconnected with the Maritime Electric Company System.

Nova Scotia.—With total fixed assets of \$197,473,826, the self-supporting Nova Scotia Power Commission is one of the largest businesses in the province. The Commission was created under the Power Commission Act of 1919 to exploit the limited but useful hydro potential of the province, as investigated by the Water Power Commission of 1915. The first objective was to develop remote sites to supply power and energy at lowest possible cost to new industry, particularly pulp and paper operations, and a few centres of population. The 1937 Rural Electrification Act, however, provided equalization grants and made it possible to carry out the formidable task of bringing power and energy to low-density farm and rural village areas. More than 6,500 miles of transmission and distribution lines conduct the energy generated by about 533,000-kw. capability in 26 stations to and from every corner of Nova Scotia. Hydro power constitutes only a fraction of base load, although it is put to optimum use for peaking purposes, thermal power having risen greatly in importance during the past decade.

11.—Capacity and Output of the Nova Scotia Power Commission, Year Ended Mar. 31, 1970

¹ Hydro unless otherwise noted.² For 16-month fiscal period.

The Nova Scotia Light and Power Company is the second major generating utility in the province and supplies an area that includes the Halifax-Dartmouth area and extensive regions in central Nova Scotia. The peak load in 1968 was 284,770 kw. and total assets were \$132,128,674. The company has nearly 1,200 employees and serves over 120,000 customers; it sold 1,275,153,000 kwh. in 1968. With the Nova Scotia Power Commission, the company forms part of the Maritime Power Pool, which includes New Brunswick and Nova Scotia. A number of municipal commissions provide power distribution within their municipalities.

New Brunswick.—The New Brunswick Electric Power Commission was incorporated under the Electric Act, 1920. Generating stations owned by the Commission at Mar. 31, 1969 were as follows:—

Plant	Type	Capacity	Plant	Type	Capacity
		kw.			kw.
Grand Falls.....	Hydro	60,500	Grand Lake.....	Steam	98,750
Musquash.....	Hydro	7,500	Saint John (Dock St.)..	Steam	19,785
Tobique.....	Hydro	20,000	Chatham.....	Steam	36,155
Beechwood.....	Hydro	115,000	Grand Manan.....	Diesel	2,365
Milltown.....	Hydro	3,200	Mactaquac.....	Hydro	300,000
Sisson.....	Hydro	9,530			
Courtenay Bay.....	Steam	269,300	TOTAL CAPACITY		939,055

All the foregoing generating units with the exception of Grand Manan are interconnected in a province-wide grid system. The statistical information given in Table 12 shows the growth of the Commission's undertakings since 1965.

The provincial electric power system is interconnected with an extensive high-voltage transmission system and, with the utilities in Nova Scotia, forms part of the Maritime Power Pool. At the end of 1969, plans were under way for important interconnections with Hydro Quebec and with utilities in the New England States. These interconnections will provide improved opportunities to meet the growing load requirements in the most economic fashion, not only in New Brunswick but throughout the Maritime Power Pool.

Quebec.—Stream and Reservoir Control.—The Quebec Streams Commission was created in 1910 (SQ 1910, c. 5) and given additional powers in 1912 (RSQ 1925, c. 46) and 1930 (SQ 1930, c. 34); it was authorized to ascertain the water resources of the province, to make recommendations regarding their control and to construct and operate certain storage dams to regulate the flow of streams. In 1955, the Commission was abolished and its powers and attributions transferred to the Hydraulic Resources Department, now the Department of Natural Resources. The rivers controlled by the Commission at the time of transfer, either by means of dams on the rivers or by regulating the outflow of lakes at the headwaters, were: the St. Maurice, the Gatineau, the Lièvre, the St. Francis, the Chicoutimi, the Au Sable and the Métis. The Commission also operated nine reservoirs on the North River, two in the watershed of the Ste. Anne de Beaupré River and one at the outlet of Lake Morin on Rivière du Loup (lower). In 1965, eleven auxiliary reservoirs on the St. Maurice System and two on the Gatineau were turned over by the Department of Natural Resources to the Quebec Hydro-Electric Commission for operation and maintenance.

Storage reservoirs otherwise controlled or operated are: the Lake St. John, the Lake Manouane and Passe Dangereuse on the Peribonca River controlled by the Aluminum Company of Canada; the Onatchiway on the Shipshaw River controlled by Price Brothers and Company Limited; Memphremagog Lake on the Magog River controlled by the Dominion Textile Company; and Témiscamingue and Quinze Lakes on the Ottawa River controlled by the federal Department of Public Works. Storage reservoirs under the control of the Quebec Hydro-Electric Commission are: Témiscouata Lake on the Mada-waska River, Kipawa Lake on the Ottawa River, Lac Dozois on the upper Ottawa River, Lac Cassé in the Bersimis River watershed and Lac Ste. Anne on the Toulmoustouc River, a tributary of the Manicouagan River.

The Quebec Hydro-Electric Commission.—The Quebec Hydro-Electric Commission was established in 1944 (SQ 1944, c. 22) for the purpose of supplying power to the municipalities, to industrial and commercial undertakings and to citizens of the Province of Quebec at the lowest rates consistent with sound financial administration. On May 1, 1963, the Commission acquired control of the following privately owned electrical utilities operating in the Province of Quebec: the Shawinigan Water and Power Company, the St. Maurice Power Corporation, the Quebec Power Company, the Southern Canada Power Company, the Gatineau Power Company, the Northern Quebec Power Company, the Saguenay

Hydro-Quebec's new Institute of Research, located on the outskirts of Montreal, will soon be the most comprehensive electrical research and testing centre in North America. The General Laboratories building (above) was opened in 1970, the High Voltage Laboratory will be completed in 1971 and the High Power Laboratory in 1972.

Electric Company, and the Lower St. Lawrence Power Company. As a result of these transactions, all electricity production, except for facilities operated by certain industrial organizations in their own manufacturing operations, was brought under the control of a single authority. The services of the Commission now cover virtually the entire province except for local distribution of small amounts of electricity by some municipalities, most of which is purchased from the Commission or its subsidiaries.

At the end of 1969, Hydro-Quebec and its subsidiaries had in operation 53 hydro-electric stations having a capacity of 9,152,891 kw., and 16 thermal-electric stations having a capacity of 656,030 kw.—a total capacity in operation of 9,808,921 kw. These facilities permit the balanced distribution of power throughout Quebec and the most efficient use of the water power resources of the province. Power plant construction under way in Quebec during 1969 is outlined at p. 752.

13.—Summary Statistics of the Operations of the Quebec Hydro-Electric Commission, 1967-69

Ontario.—The Hydro-Electric Power Commission of Ontario is a corporate entity, a self-sustaining public enterprise endowed with broad powers with respect to the supply of electricity throughout the Province of Ontario. Its authority is derived from an Act of the Provincial Legislature passed in 1906 to give effect to recommendations of earlier advisory commissions that the water powers of Ontario should be conserved and developed for the benefit of the people of the province. It now operates under the Power Commission Act (SO 1907, c. 19) passed in 1907 as an amplification of the Act of 1906 and subsequently modified from time to time (RSO 1960, c. 300, as amended). The Commission may have from three to six members, all of whom are appointed by the Lieutenant-Governor in Council. Two commissioners may be members of the Executive Council of the Province of Ontario.

The basic principle governing the financial operations of the Commission and its associated municipal utilities is that electrical service is provided at cost. The Commission interprets cost as including payments for power purchased, charges for operating and maintaining the power supply facilities, and related fixed charges. The fixed charges represent interest on debt, provisions for depreciation, allocations to reserves for contingencies and rate stabilization, and the further provision of a sinking fund reserve for retiring the Commission's capital debt. While the enterprise from its inception has been self-sustaining, the province guarantees the payment of principal and interest on all bonds issued by the Commission and held by the public. In addition, the province has materially assisted the development of agriculture by contributing under the Hydro-Electric Distribution Act toward the capital cost of extending rural distribution facilities.

Beginning in 1962, the entire provincial area served has been regarded for financial and administrative purposes as a unit, but for several years thereafter there was still no electrical connection between the Commission's facilities in northwestern Ontario and those serving customers in the remainder of the province. By early 1969, facilities for some interchange were available. They were used in that year, but interconnection entirely over Commission-owned facilities was not completed until the spring of 1970. Statistics are, therefore, presented for the two operating systems, known as the East System and the West System. They, respectively, serve the areas east and west of a line extending north from Lake Superior to the Albany River, a line that conforms roughly with the boundary dividing Thunder Bay District from the Districts of Algoma and Cochrane.

In addition to administering the enterprise over which it has direct control, the Commission, under the Power Commission Act and the Public Utilities Act, exercises certain regulatory functions, particularly with respect to the group of municipal electrical utilities that it serves. In order to provide convenient and expeditious service in this dual function of regulation and supply, the Commission subdivides its province-wide operations into seven regions with regional offices located in seven major municipalities.

The Commission is concerned primarily with the provision of electric power by generation or purchase and its delivery to the electrical utilities for resale in municipalities having cost contracts with the Commission. The Commission also supplies power in bulk, although not under cost contract, to direct customers, including industrial customers whose requirements are so large or so unusual as to make service by the local municipal utilities impracticable, mines, industries in unorganized territories, and certain interconnected systems.

In addition to these operations, which represent about 90 p.c. of its energy sales, the Commission delivers electric power to retail customers in rural areas and in a small group of 28 municipalities served by Commission-owned local distribution facilities. Retail service throughout the province is provided for the most part, however, by the municipal electrical utilities, which supply ultimate customers in most cities and towns, in many villages, and in certain populous township areas. The municipal electrical utilities are owned and operated by local commissions.

During 1969, the Commission's investment in fixed assets at cost increased by \$429,384,755 and at the end of the year amounted to \$4,098,351,192. Assets, after deducting accumulated depreciation, were \$4,128,643,797. In that year, 354 municipal electrical

utilities engaged in the retail distribution of electricity purchased power from the Commission. The assets of these utilities, after deducting accumulated depreciation, amounted to \$1,211,548,610, of which \$492,190,861 represented the equity acquired in the Commission's systems by the municipal utilities operating under cost contracts.

14.—Power Developments of The Hydro-Electric Power Commission of Ontario, Under Construction or Approved as at Dec. 31, 1969

West System.....	580,500	129,000	—
Totals.....	5,753,500	4,757,000	731,300

¹ Dependable peak capacity—the amount of power which resources can be expected to supply at the time of the system primary peak requirements, assuming that all units are available and that the supply of water is normal. This capacity will vary from time to time in accordance with changing conditions. The capacity of a source of purchased power is based on the terms of the purchase contract.

16.—Distribution of Power to Systems of The Hydro-Electric Power Commission of Ontario, Years Ended Dec. 31, 1965-69

NOTE.—Peak load generated and purchased, primary and secondary, in terms of generation.

¹ Sum of the maximum 20-minute coincident peak loads (primary plus secondary) of each of the systems operated by the Commission, given in terms of net output of the sources of supply to each system for the last month of each fiscal year.

In addition to the Ontario Hydro province-wide system, a few investor-owned utilities provide service to customers in Cornwall, Fort Erie, Gananoque and Sault Ste Marie.

Manitoba.—Manitoba Hydro is the primary developing, generating and distributing power agency in the Province of Manitoba. The corporation came into being Apr. 1, 1961, following amalgamation of the two former provincial government utilities engaged in the generation and distribution of electric power.

Manitoba Hydro operates six hydro-electric generating stations, two thermal-electric generating stations and 26 small diesel-electric generating plants. The combined generating capability is 1,501,418 kw., hydro installations accounting for 1,084,000 kw., thermal installations for 394,000 kw. and diesel installations for 23,418 kw. Four hydro stations are located on the Winnipeg River near Winnipeg, one is on the Saskatchewan River, 285 miles north of Winnipeg, and one is on the Nelson River, 450 miles northeast of Winnipeg. All six hydro stations and the thermal generating stations at Selkirk and Brandon are electrically interconnected to a common network known as the Manitoba Integrated System. Diesel installations are used to provide power to isolated northern communities where extension of hydro-electric transmission facilities are not feasible.

Manitoba Hydro serves over 600 communities and 236,913 consumers in rural Manitoba and suburban Winnipeg through a network of 37,012 miles of transmission and farm distribution lines. The Winnipeg Hydro Electric System distributes power within the corporate limits of the city of Winnipeg. A portion of this power is generated by the city system from its own hydro and thermal plants and the remainder is purchased from Manitoba Hydro.

Saskatchewan.—The Saskatchewan Power Corporation was established in 1949 by the Power Corporation Act (RSS 1965, c. 40, as amended). It succeeded the Saskatchewan Power Commission which had been in operation since 1929. The original functions of the Corporation included the generation, transmission, distribution, sale and supply of electric energy. The objective was to make electricity available to all the people of the province,

High voltage direct current is a very significant technique for moving large amounts of electric energy over great distances, and Manitoba's Nelson River Power project is an example of Canada's expertise in DC power generation and transmission. In the foreground are the transmission towers carrying power from the Nelson River at 900,000 volts DC while those in the background carry power from Grand Rapids at 230,000 volts AC.

in abundance and at reasonable rates. Since 1952, the Corporation has been authorized to produce or purchase and to transmit, distribute, sell and supply natural or manufactured gas.

In 1969, the Corporation served 130 communities with 500 population or over, 872 smaller communities and 94 summer resorts. In addition, bulk power was supplied to the cities of Saskatoon and Swift Current, the town of Battleford and Prince Albert National Park (Waskesiu). In February 1969, North-Sask Electric Ltd. was incorporated as a wholly owned subsidiary to provide and improve electrical service to communities in northern Saskatchewan.

At the end of December, the Corporation served approximately 269,200 customers composed of 203,166 "urban" (defined as one in which there are at least six customers) and 66,034 "rural" customers. Energy sales reached 4,100,000,000 kwh. with industrial customers accounting for 41 p.c. and residential customers for 19 p.c. of the total. During 1969, 4,600,000,000 kwh. was supplied to the system, almost all of it generated in Corporation plants. This was the first full year of production at the Coteau Creek Hydro Electric Station. Total hydro generation amounted to 2,400,000,000 kwh. or 49.8 p.c. of total generation in 1969. Steam generation from five plants supplied 45.4 p.c. of the total and internal combustion the remainder. A new 150,000-kw. unit was placed in service at Boundary Dam in December bringing total steam generating capacity to 682,000 kw. compared to 467,000 kw. for hydro and 111,500 kw. for internal combustion and gas turbine. The Corporation owned and operated 4,488 miles of 72-kv.-and-over transmission lines and 71,553 miles of less than 72 kv. (excluding urban distribution).

At the end of 1969, the Corporation had invested, at cost, \$479,600,000 in electrical system assets out of a total plant-in-service investment of \$695,300,000.

18.—Growth of the Saskatchewan Power Corporation, 1960-69

Year	Seasonal Gross System Peak Load	Individual Meters in Communities Served	Power Distributed ¹	Revenue

¹ Power distributed=net system kwh. (net generated plus net purchased).

Alberta.—The generation and distribution of electric power in Alberta is handled by two major investor-owned company groups and three municipal utilities. Several other municipal systems handle local distribution of power purchased from the investor-owned utilities. The Alberta Power Commission acts as a regulatory body for the electrical utility industry in the province but has no facilities of its own.

19.—Statistics of Companies or Municipalities Providing Central Station Electrical Service in Alberta, 1969

Ownership and Company or Municipality	Net Capability as at Dec. 31	Net Peak Load during 1969	Net Generation during 1969
	kw.	kw.	kwh.
Privately Owned			
Calgary Power Ltd.....	1,249,000	1,028,900	5,187,152 ¹

British Columbia.—The British Columbia Hydro and Power Authority is a corporation and an agency of the Crown in right of the Province of British Columbia. B.C. Hydro operates an extensive system of public utility services. Electric energy is generated, transmitted and distributed throughout areas of the province containing more than 90 p.c. of the population. Natural gas is purchased and distributed in Greater Vancouver and in the Fraser Valley eastward to Hope, and liquefied petroleum gas is distributed in Greater Victoria. B.C. Hydro operates three transportation services: an urban passenger transportation system serves Greater Vancouver and Greater Victoria; an interurban passenger transportation system serves Greater Vancouver, the Fraser Valley eastward to Hope, between Vancouver and Victoria and between Vancouver and Nanaimo (via ferries of the British Columbia Ferry Authority); and a rail freight system serves Greater Vancouver and the Fraser Valley eastward to Chilliwack.

Of B.C. Hydro's total electric power requirements of 13,750,000,000 kwh. for the year ended Mar. 31, 1969, 9,356,000,000 kwh. or 68.0 p.c. were produced by hydro-electric stations and 3,013,000,000 kwh. or 21.9 p.c. by thermal plants; of the remainder, 542,000,000 kwh. were purchased and 839,000,000 kwh. were received from the United States as Canada's share of downstream power benefits from the Duncan and Arrow storage projects. Kilowatt-hours of electricity sold during the year (12,237,000,000) were 10.4 p.c. higher than during the previous year. Impressive rates of increase in kilowatt-hours consumed were recorded for all categories of customers during the year ended Mar. 31, 1969. Residential consumption moved up 13.8 p.c., commercial 11.2 p.c., and industrial and bulk power 10.1 p.c. As at that date, the number of customers served with electricity by B.C. Hydro total-

led 605,188, an increase of 22,055 during the year. The average annual rate for residential customers dropped from 1.68 cents to 1.65 cents a kilowatt-hour, and the average annual residential consumption rose from 6,222 kwh. to 6,674 kwh.

**20.—Summary Statistics of the British Columbia Hydro and Power Authority,

¹ Including 567 underground circuit miles.

Control building at the Gordon M. Shrum Generating Station, British Columbia's Peace River project. The building, resembling a giant transformer, houses control and maintenance facilities for one of the world's largest operating underground power plants which, by the end of 1971, will be operating at six tenths of its ultimate capacity of 2,300,000 kw.

The West Kootenay Power and Light Company in 1969 served directly 31,700 customers in south-central British Columbia and an additional 18,800 were supplied by wholesale customers who retail within municipal areas. Total energy sales rose 9.4 p.c. in 1969 to 734,000,000 kwh. and total assets reached \$22,157,000. The company has an installed capacity of 47,250 kw. and, in addition, operates and maintains under management contract five hydro power plants owned by Cominco Ltd.

Yukon and Northwest Territories.—The Northern Canada Power Commission, operating under authority of the Northern Canada Power Commission Act (SC 1956, c. 42) is a federal agency concerned with the construction and management of public utilities on a commercial basis; it is empowered to construct and operate public utility plants in the Northwest Territories, Yukon Territory and, subject to approval of the Governor General in Council, elsewhere in Canada. The authorizing Act requires that projects undertaken by the Commission shall be self-sustaining; consequently rates charged for utilities supplied must provide sufficient revenue to cover interest on investment, repayment of principal over a period of years, operating and maintenance expenses and a contingency reserve.

The Commission has hydro-electric power developments on the Yukon River near Whitehorse and on the Mayo River near Mayo in the Yukon Territory; in the Northwest Territories, it has developments on the Snare River northwest of Yellowknife and the Taltson River northeast of Fort Smith.

The 4,500-kw. Mayo River hydro-electric power development has supplied power to mining properties in the Elsa and Keno areas and to the communities of Mayo and Keno City since 1952. The Whitehorse Rapids power development (hydro capacity 19,000 kw.), in service since 1958, supplies power to the city of Whitehorse and a copper mining operation located within a few miles of Whitehorse. A 225-mile transmission line, completed in 1969, supplies the Anvil Mining Corporation's lead and zinc mine mill complex at Faro in the Vangorda Creek area. A 9,000-kw. peaking standby diesel generating plant, situated adjacent to the hydro plant at Whitehorse, was commissioned in December 1968; an additional 5,000-kw. diesel unit was installed in 1970.

The two Snare River hydro-power developments (total capacity 13,500 kw.) commissioned in 1948 and 1960, supply power to the gold mines in the Yellowknife area and to the city of Yellowknife. These two hydro plants are operated by remote control from Yellowknife and will be supplemented by a 5,000-kw. diesel plant being constructed in Yellowknife, commencing in 1970. The Taltson River hydro-electric plant is an 18,000-kw. development supplying the lead-zinc mining and milling operation at Pine Point and the communities of Fort Smith and Pine Point, N.W.T. This plant is operated by remote control from Fort Smith.

Diesel electric power plants are operated by the Commission at Aklavik, Coppermine, Cambridge Bay, Fort Resolution, Fort Good Hope, Norman Wells, Chesterfield Inlet and Baker Lake in the Northwest Territories, at Dawson in the Yukon Territory, and at Field in British Columbia. The Commission also operates and maintains utility plants comprising electric power, central heat, water and sewerage services at Inuvik, Frobisher Bay, Fort McPherson, Fort Simpson in the Northwest Territories and Moose Factory in Ontario, and operates the water and sewerage systems at Dawson and Faro in the Yukon Territory.

Investor-owned generation provides electric-power service to several regions within the Territories. In the Yukon Territory, Yukon Electric Company Ltd. has generation facilities near Whitehorse and several isolated diesel plants. In addition, the Company provides distribution of electric power in Whitehorse, Carmacks, Carcross and Keno Hill with supplies purchased from the Northern Canada Power Commission. In the Northwest Territories, Plains Western Gas and Electric Co. Ltd. distributes power (supplied by NCPG) in Yellowknife, and Northland Utilities has generation and distribution facilities in Hay River, Fort Providence and Enterprise.

CHAPTER XVI.—MANUFACTURES*

CONSPECTUS

	PAGE		PAGE
SECTION 1. STATISTICAL DATA ON CANADIAN MANUFACTURING INDUSTRIES.....	773	Subsection 5. Exports of Manufactured Goods.....	793

The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.

Section 1 of this Chapter contains a summary of the regularly issued statistical data on the manufacturing industries of Canada, based on the annual Census of Manufactures and on monthly and quarterly surveys. Section 2 is a special study of interprovincial shipments of the products of Canadian manufacturers which is based on the results of the first complete survey to be taken of all but the smallest manufacturers and relates to the year 1967.

Section 1.—Statistical Data on Canadian Manufacturing Industries

Statistics on the manufacturing industries are issued by the Dominion Bureau of Statistics on an annual, monthly and quarterly basis, depending on the type of data. The basic annual data are the results of the annual Census of Manufactures. Among the monthly figures available, two important sets of data provide a basis for projecting figures of the annual Census of Manufactures—the monthly survey of manufacturers' shipments, inventories and orders, and monthly estimates of employees by industry.

The monthly shipments, inventories and orders series is published for the manufacturing industries of Canada and the provinces, with breakdowns by industry group and by selected industry in the case of the totals for Canada. They are based on a survey of respondents to the annual Census and are projections of the Census total, with the qualification that new entries into the manufacturing industries since then are not covered. (This contributes to the tendency shown by monthly shipments figures, for instance, to fall slightly below those of the subsequent annual Census for the same year.) The monthly estimates of employees by industry provide figures on total employees in the manufacturing industries for Canada and the provinces, each classified into durable and non-durable industries. Like the monthly shipments survey, the figures are based partly on statistical sampling. Both sets of monthly figures also yield totals for the calendar year, while the annual Census includes some reports made on a respondent's fiscal year differing from the calendar year. (The effect of this is not large.)

* Prepared in the Manufacturing and Primary Industries Division, Dominion Bureau of Statistics.

These data relate to establishments—roughly corresponding to the popular conception of a plant, factory or mill—and, for certain statistics, to non-manufacturing units known as “head offices, sales offices and auxiliary units”. For some purposes, companies rather than plants or factories are of interest. For example, a company owning factories, mines and merchandising outlets will normally report its profit for the whole company rather than dividing it among the different industrial activities in which it is engaged. Thus, the quarterly survey of corporation profits provides figures on sales, profits and certain other statistics for whole companies classified to industries on the basis of their principal activities (for instance, factories might be included in mining or mines in the manufacturing industry). Such figures are generally not comparable with establishment statistics.

Various other monthly and quarterly surveys relate to commodities rather than to establishments or companies. That is, they account for production or shipments of particular products without regard to the industry in which they are produced.

In addition to providing estimates of over-all employment in manufacturing (and other industries), monthly surveying of employment, hours and payrolls results in indexes of employment for larger establishments by industry and by province and sub-provincial area, and in data on average hours and earnings. Monthly indexes of industrial production provide measures of the physical volume of output of the manufacturing industries. That is, they measure output, net of the effects of price changes. These indexes afford annual averages which can be used to indicate movement in the real domestic product at factor cost originating in the manufacturing industries. In addition, many users find valuable information in the large number of monthly industry selling price indexes for various manufacturing industries.

Subsection 1.—Post-Census Data on Manufacturing

This Subsection is included to give some preliminary data for 1969 and 1970 based on monthly or quarterly surveys, since the results of the Census of Manufactures for 1969 were still in the processing stage at the time of preparation of this Chapter. Some factors influencing the levels of current and annual Census figures in comparison with each other are indicated in the preceding text.

Table 1 compares the value of shipments of goods of own manufacture by province for the year 1970 with comparable data for 1969 and earlier censuses, and Table 2 makes similar comparisons for industry groups. Table 3 gives estimates of employees in Canadian manufacturing industries by province for 1968, 1969 and (August) 1970, with 1968 Census figures included for comparison. Table 4 gives company data on profitability in various manufacturing industry groups in 1969 compared with annual Census figures from 1962.

1. -Value of Shipments of Goods of Own Manufacture, by Province, 1961 and 1966-70

Province or Territory	1961	1966	1967	1968	1969 ^a	1970 ^a

Subsection 2.—Census of Manufactures Data by Industry

Results of the Census of Manufactures are published industry by industry as they become available. Although statistics for the 1969 Census were appearing as this Chapter was being prepared (January 1970), the Census of 1968 was the latest for which all industries had been issued. Tables 5 to 7 show selected results of the 1968 Census for industry groups and individual industries compared with figures for earlier censuses. To help visualize some of the changes that took place in individual manufacturing industries in 1968, Table 8 shows the largest increases or decreases in number of employees; widely divergent movements characterized these industries.

5.—Summary Statistics of Manufactures, 1961-68

Year	MANUFACTURING ACTIVITY							
	Estab-lish-ments	Production and Related Workers			Cost of Fuel and Elec-tricity ¹	Cost of Materials and Supplies Used	Value of Shipments of Goods of Own Manu-facture	Value Added
		Number	Man-Hours Paid	Wages				
	No.		'000	\$'000	\$'000	\$'000	\$'000	\$'000
1961.....	33,357	939,413	1,968,163	3,532,943	516,409	12,579,798	23,438,956	10,434,832

¹ Cannot be reported separately for manufacturing and non-manufacturing activities but related substantially to manufacturing activity.

² Includes production and related workers, administrative and office employees, sales, distribution and other employees; excludes working owners and partners.

³ Includes supplies used in both manufacturing and non-manufacturing activity.

⁴ Includes shipments of goods of own manufacture, value of shipments of goods purchased for resale and other operational revenue.

⁵ Value of total operational revenue less total cost of materials, supplies, fuel and electricity used and goods purchased for resale in the same condition; all adjusted for inventory changes where required.

Industry Group and Year	Estab-lish-ments	MANUFACTURING ACTIVITY					TOTAL ACTIVITY

13	Miscellaneous machinery and equipment manufacturers.....	48,852	47,813	—1,039	—2.1

Subsection 3.—Distribution of Manufacturing by Province and by Census Metropolitan Area**Distribution by Province**

According to the results of the Census of Manufactures, Central Canada accounted for about four of every five dollars of all value added by the manufacturing activity of the manufacturing industries of Canada in 1968; Ontario's share was 53.0 p.c., and Quebec's share 28.4 p.c. British Columbia was third in this respect, with 8.6 p.c. of the value added by manufacture, the Prairie Provinces accounted for 6.6 p.c. and the Atlantic Provinces for 3.3 p.c. One way of comparing the intensity of manufacturing activity in these regions is in terms of value added per capita of their population. The Canada average was \$884 per capita but the Ontario average per capita of its population was \$1,330, reflecting the high degree of industrialization of that province's economy. Comparable per capita rates of manufacturing activity for other regions were: Quebec, \$880; British Columbia, \$785; Prairie Provinces, \$352; and Atlantic Provinces, \$303.

9.—Summary Statistics of Manufactures, by Province, 1967 and 1968

NOTE.—Based on the revised standard industrial classification and new establishment and total activity concepts.

Province or Territory and Year	Estab- lish- ments	MANUFACTURING ACTIVITY						TOTAL ACTIVITY				
		Production and Related Workers			Cost of Fuel and Elec- tricity	Cost of Materials and Supplies Used	Value of Ship- ments of Goods and Manu- facture	Value Added	Total Employees		Total Value Added

1 Confidential.

Distribution by Metropolitan Area

Table 11 shows the latest annual Census of Manufactures (1966 and 1967) data for 18 Census Metropolitan Areas for which information can be published. These exclude employees and activity of head offices, sales offices and auxiliary units which are included in manufacturing industry totals for Canada and the provinces given in Subsection 2.

Almost every sector of Canadian economic activity involves the use of steel and Canada's steel production has doubled during the past decade, outpacing the country's general expansion and moving to markets around the world.

For Canada's largest suspension bridge recently built in Quebec City, one company alone supplied 17,700 miles of galvanized steel cable wire, 600,000 structural bolts, 5,040 tons of steel plate and 2,150 tons of reinforcing steel.

More than two million pounds of stainless steel will sheath the exterior of the 57-storey Canadian Imperial Bank of Commerce building under construction in Toronto.

11.—Summary Statistics of Manufactures, by Census Metropolitan Area, 1966 and 1967

Census Metropolitan Area and Year	Estab-lish-ments	MANUFACTURING ACTIVITY										TOTAL ACTIVITY	
		Production and Related Workers				Cost of Fuel and Elec-tricity	Cost of Materials and Supplies Used	Value of Ship-ments of Goods and Ovn Manu-facture	Value Added	Total Employees		Total Value Added	
		Number	Man-Hours Paid	Wages	Number					Salaries and Wages

1 Classified as a Census Metropolitan Area commencing 1966; CMA is coextensive with city.

According to the latest estimates of employees by industry available at the time of writing (August 1970), employees of the manufacturing industries in the Toronto and Montreal Metropolitan Areas accounted for 36 p.c. of the Canadian total. These two areas together with Vancouver and Winnipeg Metropolitan Areas accounted for 43 p.c. of the total. The average monthly estimates for 1969 and the August 1970 preliminary estimates (unadjusted for seasonal variation) were:—

<i>Metropolitan Area</i>	<i>Employees in Manufacturing Industries</i>	
	<i>1969 Average</i>	<i>August 1970</i>
Toronto.....	322,300	318,200
Montreal.....	300,500	304,900
Vancouver.....	70,300	69,200
Winnipeg.....	41,800	40,900

Subsection 4.—Size of Manufacturing Establishments Based on Employment and Shipments

Although the average size of a manufacturing establishment in terms of number of employees is about 50, establishments with 200 or more employees account for about one half of all employment in the manufacturing industries. The average size of establishments with 1,500 or more employees indicates that there are some with very much larger employment than that minimum; the average size of establishments in this class-size is more than double its lower limit.

Size Based on Shipments

The average size of a manufacturing establishment in terms of shipments of goods of own manufacture was \$1,171,000 in 1967, about two thirds greater than in 1961. However, this average size is greatly affected by the large number of very small establishments which in fact account for only a minor share of over-all shipments. Establishments with \$1,000,000 or more shipments of goods of own manufacture in 1967 accounted for about one establishment in six but for about \$13 out of every \$15 of shipments.

16.—Establishments and Shipments in the Manufacturing Industries, by Shipments per Establishment, 1961 and 1967

Subsection 5.—Exports of Manufactured Goods

In recent years, far-reaching changes have taken place in the character of Canada's exports of manufactured goods. This country has traditionally been known as an exporter of fabricated materials but in 1969, for the first time, domestic exports of end products, consisting of highly manufactured goods, exceeded those of fabricated materials. This change and the trends leading up to it are shown in the following figures:—

Year	Domestic Exports of—		
	Fabricated Materials	End Products	Total Manufactured Goods
	\$'000,000	\$'000,000	\$'000,000
1961.....	2,916.4	706.4	3,622.9
1965.....	3,923.5	1,606.3	5,529.8
1966.....	4,217.0	2,455.1	6,672.1
1967.....	4,417.3	3,467.4	7,884.7
1968.....	5,027.9	4,702.4	9,730.3
1969.....	5,344.9	5,811.7	11,156.6

A comparison of these figures with those in Table 5 will show that the ratio that these apparent exports bears to over-all shipments of manufacturers has been rising in recent years; however, the two series are not completely comparable principally because of problems of valuation of manufacturers' shipments of metals (explained in Section 2, p. 796). It should also be noted that the most important single reason for the rapidly rising level of exports of Canadian manufactured products in the end-product category is the Canada-United States Agreement on Automotive Products, which went into effect in 1965.

Section 2.—Origin and Destination of Canadian Manufacturers' Shipments

Information on the types and quantities of goods which the different countries of the world ship to one another constitutes one of the oldest forms of official statistics. Such data have been available for centuries in Canada's parent nations—Britain and France—and in Canada itself from colonial days. However, statistics on the flow of goods between different parts of the same country have only recently become of widespread interest. In Canada, the demand for such figures has been growing because of their relevance to the needs of many current and potential users. For instance, they have a bearing on the economic relationships that underlie the political relationships of Confederation; they are important to any intensive investigation of regional disparity in economic development and they are raw material for the statistician in the preparation of regional economic accounts; they may offer insights into the spread of business fluctuations through the economy (even if the data are available only for a base year); and they afford partial measures of markets for businessmen and for officials concerned with the establishment of new industries.

Interprovincial shipments of Canadian manufacturers have been the subject of some limited studies for particular regions and such information has sometimes been gathered in a comprehensive fashion for a particular industry or product line. For the first time, however, a complete survey of the interprovincial shipments of all but the smallest manufacturers has now been carried out, along with figures gathered on manufacturers' direct shipments to other countries.* The survey relates to manufacturers' shipments in 1967 and was conducted by the Merchandising and Services Division in co-operation with the Manufacturing and Primary Industries Division of the Dominion Bureau of Statistics and by the Quebec Bureau of Statistics.

Basis of the Survey

All respondents to the 1967 annual Census of Manufactures were sent a supplementary questionnaire except, as mentioned above, the very small manufacturers who, because they account for a minor percentage of their industry's shipments, customarily receive an abbreviated census form. Estimates of the interprovincial shipments of these small manufacturers, many of whom ship mainly to markets in the same locality or province, were included in the survey results. Thus was secured for 1967 a comprehensive statistical picture of where the products of Canadian factories went when shipped to their first destinations, subject to some qualifications or perhaps distortions arising from limitations in the concepts of the survey or in the reporting capabilities of the manufacturers. It was found that, in that year, 56 p.c. of the value of all shipments had first destinations in the same province as the establishment from which they originated. About two dollars in seven, or 28 p.c. of the total value, went to other first destinations in Canada and one dollar in six, or 16 p.c., went direct to other countries. The patterns naturally vary widely from one industry to another and from one province or region of origin to another, as shown in Table 18.

¹ Confidential.² Includes the Yukon and Northwest Territories.

The proportions of over-all shipments by Ontario and Quebec manufacturers going direct to other countries, at 14.5 p.c. and 15.3 p.c., respectively, were below the national average of 16 p.c. On the other hand, the provinces with heavier relative dependence on the processing of natural resources had apparent export shares above the national average. For instance, in Newfoundland, 60.3 p.c. of shipments were reported as going to other countries. This was the highest export share for any province and was largely a reflection of the prominence of the paper and allied industries among its manufactures. British Columbia (including the Yukon and Northwest Territories) was in second place in this respect, having 36.5 p.c. of its shipments going to other countries as a first destination. However, the British Columbia figures are an example of the sometimes misleading effect of the first-destination criterion. It is known that large amounts of lumber are sold by secondary distributors in the province and that much of the lumber so sold ultimately reaches markets in other countries. The result is a disappearance in British Columbia of products of the wood industries which is much above anything plausible, even after taking account of the preferences of British Columbians for wood construction. Even so, the first-destination criterion was the only practicable one to use and, for some purposes, provides the most relevant information. Thus, movement of the products of some industries, perhaps in carload lots, to wholesaling centres for redistribution in small lots may be meaningful for an analysis of the demand for transportation. Likewise, in seeking to attract industry to produce, for example, consumer goods characteristically sold through wholesalers, the location of the wholesalers rather than of the ultimate consumers might represent the market from a prospective manufacturer's viewpoint.

It should be noted also that reshipments of British Columbia lumber by secondary distributors are an important contributing factor in causing the total shipments to other countries from all the manufacturing industries of Canada to fall well below the level of exports of Canadian manufactured goods indicated in external trade data (see pp. 793-794). An additional factor is the large shortfall in exports reported by motor vehicle manufacturers from the known level of exports of motor vehicles. In this area, some reporting companies are apparently exporting through head offices or sales offices which are separate reporting units statistically but are not manufacturing establishments, so that their shipments to other countries are not shipments of goods of own manufacture according to Census of Manufactures definitions. A transfer to the books of another unit of the same company is treated, however, as a shipment in the Census, with the location, in this case, in Canada.

Another large contribution to the over-all shortfall in apparent exports of all manufactured goods originates in the primary metal industries. This arises from the fact that shipments of the smelting and refining industry include large amounts of work done for reporting units in the mining industry owned by the same companies as the smelters. In such cases, the mining industry makes the final shipment of the metals, perhaps to other countries, at their full sale value, while the corresponding manufacturing industry "shipments" are only an imputed custom charge for processing the ore; the destination of the smelter's shipment can be that of a reporting unit in Canada even if the metals are exported.

The over-all manufacturing shipments totals do not agree exactly with the Census totals published elsewhere in the Year Book because of certain adjustments, such as the exclusion of advertising revenue of publishers and repair work of some industries.

Patterns of Interregional Shipments and of Provincial Demand

The ability of manufacturers in a particular region or province to ship to another section of Canada or to other countries reflects a variety of influences, among which is the nature of the industries within a region. Thus, the heavy concentration of motor vehicle manufacturing in Ontario predisposes shipments from this region to the most distant regions of Canada and to other countries. Also, the heavy concentration of industrial machinery manufacturing industries in Ontario and Quebec means widespread shipments to other parts of Canada, even though there is a concentration of demand for such machinery within the region itself and a large proportion of the shipments will remain there. In some of the smaller provinces, the representative manufacturing industries either are oriented toward the processing of natural resources for shipment to other regions or countries or tend to be of a type serving local or regional markets. The processing of natural resource products can involve widespread distribution beyond a province's borders which may offset the more localized distribution of the products of other industries in the province.

The degree to which manufacturers' domestic shipments go to Canadian first destinations outside the borders of a province is not itself an indicator of the degree to which that province's industries are able to penetrate markets in other parts of Canada. A large province, in terms of the total of its over-all manufacturers' shipments, naturally has more opportunities for internal transactions; Ontario, for example, has a large capacity to originate shipments and also a large demand for such shipments. In addition, shipments to other parts of Canada may be some particular percentage of the originating province's shipments but represent either a relatively high or a relatively low performance in terms of the potential offered by the external markets. This potential is influenced by the size of the external markets, their distances and their special characteristics (such as, for example, possessing capital-intensive industries which constitute a demand for machinery). These factors interact in a highly complex manner.

Table 19 summarizes the percentage distribution of the destinations of shipments of different regions of Canada and Table 20 shows the relative penetration of the apparent market for Canadian manufactures in different regions of Canada in terms of the percentage

of over-all disappearance of Canadian manufactures accounted for by various Canadian sources. The percentage distribution of sources of exports and total shipment is also shown.

19.—Percentage Distribution of Shipments of Manufacturing Industries by First Destination of Shipments

Region of Origin	First Destination of Shipments							
	Atlantic Provinces	Quebec	Ontario	Prairie Provinces	British Columbia, Yukon and Northwest Territories	All Canadian Destinations	Other Countries	Total

20.—Sources of Supply of Canadian Manufacturers' Shipments Destined to Regions of Canada and to Other Countries, 1967

(Relative percentage participation of manufacturers of regions of Canada in apparent regional markets for Canadian manufactures)

Region of Origin	First Destination of Shipments							
	Atlantic Provinces	Quebec	Ontario	Prairie Provinces	British Columbia, Yukon and Northwest Territories	All Canadian Destinations	Other Countries	All Destinations
	p.c.	p.c.	p.c.	p.c.	p.c.	p.c.	p.c.	p.c.
Atlantic Provinces.....	40.1	1.3	0.8	0.6	0.3	3.2	5.7	3.6
Quebec.....	21.7	66.1	14.8	11.2	10.3	28.5	26.5	28.2
Ontario.....	35.5	29.8	81.7	33.2	27.4	53.3	46.3	52.1
Prairie Provinces.....	1.7	2.1	1.8	49.0	7.6	8.8	3.3	7.9
British Columbia, Yukon and Northwest Territories.....	1.0	0.7	0.9	6.0	54.4	6.2	18.2	8.2
Canada.....	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

It will be seen, for instance, that while manufacturers in the Atlantic Provinces send about the same percentage of their over-all shipments to Quebec as to Ontario, their percentage penetration of the more distant but larger Ontario market is somewhat lower. Their percentage share of apparent markets for Canadian manufacturers declines with distance from the Atlantic region.

Quebec manufacturers' shipments to the Atlantic Provinces are more than half those of Ontario manufacturers, whereas the corresponding ratio is about one to three in the Western Canada market. This is not surprising since Quebec is nearer than Ontario to the Atlantic Provinces market. On the other hand, Quebec's position relative to Ontario's in the western provinces shows little decline as one progresses toward the Pacific Coast and actually rises in British Columbia. The fact that the largest manufacturing areas of both central provinces are roughly equidistant by rail from these markets is perhaps relevant but also im-

portant are the effects of specialization in Central Canada and the nature of regional demand. Concentrated demand for farm machinery in the Prairie Provinces, for instance, favours shipments from Ontario where Canadian production of farm machinery is highly concentrated; Quebec's specialization in certain non-durable goods industries contributes to its relative strength in the British Columbia market. Again, it must be remembered that imported goods are not included and that manufacturers in a particular region may use secondary distributors to one market more than to another.

It might be supposed that the manufacturers of the Prairie Provinces would not ship as large a percentage of their products outside their borders as do the manufacturers of some other regions, and this is so. It might also be supposed that the Prairie Provinces' markets for their products in other regions of Canada would be less diversified than for manufacturers of most other regions. This is not so, however, in the sense that shipments that do leave the Prairie Provinces to other parts of Canada are widely dispersed and relatively unconcentrated geographically; roughly equivalent dollar amounts and percentages of the region's over-all shipments go to Quebec, to Ontario and to British Columbia.

A comparison of shipments of various regions to other regions, per capita of the receiving region, yields somewhat similar patterns to those shown in Table 20, except that per capita disappearance of manufactures in some regions is much higher than in others. Table 21 shows the per capita disappearance in various provinces of the shipments of different industry groups. It will be seen that the apparent absorption of products is roughly the same in the more urbanized areas of Canada for some industries but for others it varies sharply. Investigation of the reasons for the variations points in some instances to meaningful differences in the market, to the probable influence of secondary distribution or possibly, in some cases, to anomalies in reporting.

The manufacturing industries themselves use many products of Canadian factories, such as steel, cotton yarn or machinery. Thus, provinces with highly developed manufacturing industries not related to use of local natural resources should tend to have higher per capita receipts of manufactures on an over-all basis; Table 21 shows that this is so. In addition, high per capita personal income or high levels of construction activity in a particular year should favour high per capita receipts of the products of certain industry groups, which appears to be the case.

As in all the data, secondary distribution of lumber has distorted the distribution of shipments of the wood industries. The demand in the Prairie Provinces for agricultural machinery is reflected in a high per capita disappearance of products of the machinery industries. Manitoba's high per capita disappearance of products of the food and beverage industries and of a number of other industries undoubtedly reflects distributing activity located in Winnipeg, since the lower per capita disappearance of these industries' products in Saskatchewan would hardly reflect a proportionately lower level of consumption by Saskatchewanians. Although variation in apparent absorption per capita in the individual Atlantic Provinces also reflects the effects of secondary distribution, there is doubtless an over-all influence from lower per capita personal incomes.

When the data are examined at the level of shipments of individual industries, it appears that the market is more influenced by population in some cases and by personal disposable income in others. Thus, per capita disappearance of the products of soft drink manufacturers is relatively stable across the country, except for being very high in Quebec, but it varies sharply if calculated on per thousand dollars of personal income which shows it to be much higher in lower income provinces. On the other hand, the disappearance of products of manufacturers of toilet preparations varies sharply per capita but is either \$2 or \$3 per thousand dollars of personal disposable income for every province across Canada. This presumably reflects the partial luxury status of the goods. An adequate analysis of demand for consumer products must, of course, go beyond such simple comparisons and use more extensive data. The full report contains a wealth of information by province and by industry.

Section 3.—Government Assistance to Manufacturing

Subsection 1.—Federal Assistance to Manufacturing*

The Department of Industry, Trade and Commerce (a merger of the former Departments of Industry and of Trade and Commerce Apr. 1, 1969) has responsibility for stimulating the establishment, growth and efficiency of the manufacturing, processing and tourist industries in Canada, and also for the development of export trade and external trade policies. It assists Canadian industries to initiate and take advantage of technological advances, improve products and services, increase productivity and expand domestic and foreign markets. To achieve these goals, a wide variety of programs and services are offered. At each phase of the product cycle—from research, development and design through production and marketing—the Department can assist with information and financial assistance.

Program for the Advancement of Industrial Technology (PAIT).—A program of forgivable loans for the development of new products and processes was initiated in 1965 and in 1970 was changed to provide non-repayable cash grants for qualifying projects. The objective of PAIT is to encourage industrial growth and production by providing financial assistance for the development of new or improved products and processes which incorporate new technology and offer good opportunities for commercial exploitation in domestic and international markets.

Financial assistance in the form of a grant (normally 50 p.c. of the development and preproduction cost) is available to companies incorporated in Canada for projects to be carried out and exploited in Canada. Title to any invention or patent is vested in and remains the property of the company. Companies are expected to have the capabilities and facilities to undertake the development work and also to provide for the manufacture and sale of the resulting products. The program is designed to increase the technical competitiveness of Canadian industry and is also intended to help create an industrial environment attractive to Canada's best-qualified scientific, technical and managerial personnel.

To Mar. 31, 1970, 229 projects having a total estimated value of \$72,000,000 had been assisted by the Government to the extent of approximately \$37,000,000.

Industrial Research and Development Incentives Act.—This legislation, enacted in March 1967 and administered by the Department of Industry, Trade and Commerce, provides cash grants or equivalent tax credits equal to 25 p.c. of capital expenditures of corporations for scientific research and development conducted in Canada, and for the increase in current expenditures in Canada for scientific research and development over the average of such expenditures in the preceding five years. To qualify for a grant, expenditures must be for scientific research and development which, if successful, is likely to lead to or facilitate an extension of the business of the corporation. In addition, a corporation must undertake to exploit the results of the research and development in Canada and must normally be free to export products resulting from such research and development to all countries of the world.

Automotive Program.—The Canada-United States Agreement on Automotive Products signed by the Prime Minister of Canada and the President of the United States on Jan. 16, 1965, provides for the removal of tariffs and other impediments to trade between the two countries in motor vehicles and original equipment parts. The basic objectives of the Agreement are: creation of a broader market to permit benefits of specialization and scale; trade liberalization to enable both countries to participate in the North American market on a fair and equitable basis; and development of conditions in which market forces would operate to attain economic patterns of investment, production and trade.

* Prepared in the Publicity Branch, Canadian Division, Department of Industry, Trade and Commerce, Ottawa.

As a result of this program, Canada is now producing an increasingly larger share of the total North American output of vehicles and components. Canadian exports of vehicles and parts and employment in this industry have increased substantially, and additional investment in new plants and expansion to existing facilities have been extensive. Although all of the objectives have not yet been fully realized, the Agreement is working well.

Machinery Program.—A machinery program was introduced on Jan. 1, 1968, with the objective of increasing efficiency in Canadian industry by enabling machinery users to acquire advanced capital equipment at the lowest possible cost while affording Canadian machinery producers tariff protection on what they manufacture. At the same time, Canadian machinery producers are protected by a single statutory rate of duty which applies immediately when they are in a position to supply. This is particularly significant for Canadian producers of custom-engineered machinery.

The program covers a broad range of machines classifiable under Tariff Item 42700-1 including general-purpose machinery, metalworking and woodworking machinery, construction and materials handling equipment and various types of special industry machinery, such as pulp and paper and plastics industry machinery, and service industry equipment. The statutory rate of duty under that Tariff Item is $2\frac{1}{2}$ p.c. British preferential and 15 p.c. most-favoured-nation.

The program provides that the duty otherwise payable on machines, accessories, attachments, control equipment, tools and components, imported under Tariff Item 42700-1, may be remitted if such remission is in the public interest and the goods imported are not available from production in Canada. A Machinery and Equipment Advisory Board advises the Minister of Industry, Trade and Commerce regarding the eligibility of machinery for remission of duty in accordance with the provisions of the Tariff item. The Board, in turn, is assisted by the Branches of the Department concerned with individual industries, including machinery manufacturing. Final authority for granting remission lies with the Governor in Council.

Under the program, machinery producers may also apply for remission of duty on production parts and components included in Tariff Item 42700-1 which they cannot procure in Canada. This provision is for the purpose of stimulating Canadian machinery manufacturers to specialize their production and enable them to compete more effectively.

Building Equipment, Accessories and Materials Program (BEAM).—The BEAM program was established to assist in achieving greater efficiency and productivity in the manufacture and use of building equipment accessories and materials, thereby realizing economic gains from the industry's domestic and foreign activities. The objectives of the program include: establishment of a comprehensive National Construction Information System; encouragement of modular dimensional standardization and co-ordination; acceleration of the industrialization of the building process; development and expansion of export markets; promotion of uniform building regulations and standards; and encouragement of building design excellence through awards programs.

The program is being implemented and is subject to further development through the Construction Industry Development Council and in co-operation with industry through the major associations. The Council, which is responsible to the Minister of Industry, Trade and Commerce, is national in scope, comprised of 35 representatives of the manufacturing, design and contracting sectors of the industry as well as labour unions, universities and government. It provides a forum for industry-government dialogue on matters of economic and technological importance to the construction industry and a means of assisting the industry to become a modern integrated industry with a high potential for competing in export markets. Co-operating directly in the BEAM program are the Canadian Construction Association, the Royal Architectural Institute of Canada, the Association of Consulting Engineers of Canada, the Specification Writers Association and the National Home Builders Association.

Having established the needs and priorities for construction information in Canada, ways in which a comprehensive and flexible information system can be developed have been identified. An experimental system has been put into operation and user reactions are being assessed. At the same time, a thesaurus of Canadian construction industry terminology is being developed in both English and French to enable users to find terms for given meanings and to resolve the ambiguity in natural language terminology. Originally, the Industry Advisory Committee on Construction Information Systems advised departmental officers on this aspect of the BEAM program. Now this group functions as a sub-committee of the Construction Industry Development Council.

The Department has developed a program to encourage the increased use of dimensional standardization of building components. Initially, a series of six conferences was held to acquaint policymakers within the industry with the technological and economic advantages of modular standardization. Following these conferences a continuing program of Clinics of Modular Practice was organized, the clinics being held in all parts of Canada to instruct architects, engineers, draftsmen and building supervisors on modular principles in buildings. Over 90 clinics have been held to date and more than 5,000 design professionals, draftsmen, contractors and manufacturers have participated. A directory of Canadian Modular Building Components was published and distributed and a second edition is being prepared in both English and French.

Further, orderly intelligent industrialization of the building process has been encouraged under BEAM through technical missions, publications and conferences. In this connection, a National Conference on a Systems Approach to Building was held in April 1968 to inform all sectors of the industry on the development of industrialized building techniques, following which seven regional conferences were held in October-November 1969 across Canada, with leading authorities participating in the lectures and seminars. More than 2,500 senior representatives of the design profession and industry attended.

It seems likely that the BEAM Industry Advisory Committees on Modular Coordination and Industrialized Building Techniques and Systems will be integrated to serve as a sub-committee on systems building to the Construction Industry Development Council.

The promotion of universal use of the National Building Code is continuing. Ontario is taking specific action in this regard and Nova Scotia, New Brunswick, Manitoba, Saskatchewan and British Columbia are considering similar action. An index of all codes, standards and specifications used in the Canadian construction industry has been compiled, which will facilitate wider use of such standards in the industry.

Industrial Design.—The design program, under authority of the National Design Council Act, administered by the Department of Industry, Trade and Commerce, implements programs to promote and expedite improvement in the products of Canadian industry. The Department is also responsible for developing and carrying out programs and projects that may be appropriate to the utilization of improved industrial design.

Current design programs include: financial and technical assistance to co-operating educational institutes for the purpose of introducing design training at the technical and university levels; seminars on various facets of design for the benefit of the professions, educators, business executives and the general public; awards programs for achievements over a broad field of design endeavour; the awarding of scholarships for advanced training in industrial design in Canada and abroad; the awarding of grants for design research and design promotion in Canada; and the provision of technical and financial assistance to committees and groups dedicated to the implementation of programs to foster good design on a national, regional or industry basis.

Extensive studies conducted in 1969 into the state of design in Canada revealed that the focus of attention should be directed to the manufacturing sector. As a result, the operation of the Design Canada Centres ceased on Mar. 31, 1970, and a program of industrial design assistance was introduced in 1970-71, under which financial support is given to the manufacturing industries that demonstrate their interest in developing new and

improved designs by employing qualified industrial design services. Such assistance is available to companies incorporated in Canada, to groups of companies organized as consortia, and to trade associations that can satisfy program requirements; it is concentrated on relatively short-term projects of product innovation and is limited to 50 p.c. of the industrial design operational and administrative costs, subject to the technical and commercial feasibility of the project.

In recognition of the outstanding contribution of Canadian business management toward the cause of good design, a National Design Council Chairman's Award for Design Management was introduced in 1970, to be presented to the management which, in the Council's opinion, does the most to integrate and efficiently apply good corporate design policy. This Award is conceived in the broadest terms of a total design management context—from the premises to the packaging.

Defence Industry Productivity Program.—This program (combining the former Industry Modernization for Defence Exports Program and the Development Sharing Program) is designed to enhance the technological competence of the Canadian defence industry in its export activities by providing financial assistance to industrial firms for selected projects. Emphasis is placed on those areas of defence technology having civil export sales potential. Assistance may cover the development of products for export purposes; the acquisition of modern machine tools and other advanced manufacturing equipment to meet exacting military standards; and assistance with preproduction expenses to establish manufacturing sources in Canada for export markets.

Projects initiated under this program have greatly assisted industry in developing skills on a specialized basis in fields of technology that have defence and civil applications, which Canada is favourably situated to exploit. Costs of these projects are shared by the Department and the Canadian firm concerned, and, in some instances, by the governments of other NATO countries. Manufacturing equipment projects are selected for assistance on the basis that the machinery acquired will make a significant contribution to increased productivity. Generally this means that the machinery is the most advanced of its type, such as numerically controlled metalworking equipment.

Automotive Adjustment Assistance Program.—This program, which remains in force until June 30, 1971, offers opportunities to Canadian automotive parts manufacturers for expanded production, rationalization of output and reduced costs. In order to take advantage of these opportunities, Canadian parts makers must engage in substantial re-equipment and plant expansion programs. Term loans are made available for the financing of the acquisition, construction, installation and modernization of facilities or machinery and for use as working capital. To further assist automotive parts producers to become more productive and competitive, the Adjustment Assistance Board considers applications for tariff remission on imported machinery and equipment used in the production of original equipment automotive parts, accessories and tooling, when such machinery and equipment are not available from Canadian sources in time to meet production schedules.

General Adjustment Assistance Program.—The objectives of this program, which are related to the Kennedy Round Agreements, are to enable Canadian industries to benefit as much as possible from the widening markets and the increased scope for specialization and longer production runs, and to assist firms adversely affected by increased imports resulting from tariff quotas made by Canada to adapt to more competitive conditions. Under this program, the Government proposes to offer insurance on the major share of risk of loss for industrial adjustment assistance loans made by private lenders. Where injury can be proved, direct loans may be made. Assistance in the form of grants may also be offered to manufacturers to contribute to the costs of preparing adjustment proposals to improve production, marketing and financial operations.

Ship Construction Subsidy Regulations.—Since 1967, the Department of Industry, Trade and Commerce has been responsible for shipbuilding matters, including the Ship

Construction Subsidy Regulations and certain sections of the Income Tax Act and Regulations. The industry continues to respond to the policy of national competition for government shipbuilding requirements and has made active use of the subsidy program for commercial vessels. The latter provided a subsidy rate of 25 p.c. for vessels other than fishing trawlers for the period 1966-69, after which time it is being reduced by $\frac{1}{4}$ of 1 p.c. each quarter until a rate of 17 p.c. is reached in 1973. For fishing vessels, the subsidy rate is 35 p.c. With the support of other programs, the Department has encouraged the development of production of marine components and exports in this area have been increased.

Subsection 2.—Provincial Assistance to Manufacturing*

Assistance given by the respective provincial governments to manufacturing within their own territories is outlined in the following paragraphs.

Newfoundland.—The Newfoundland Government offers the following forms of assistance to prospective manufacturing firms:

- (1) The government offers advice and assistance to prospective industry in determining desirable plant location in the province and in the preparation of feasibility studies. Information can be made available on the source and availability of raw materials, transportation costs, labour costs and a variety of other economic data. The government will transport industrialists anywhere in the province so that they may obtain a first-hand look at potential plant sites.
- (2) Financial assistance may be provided by the government directly or through its Crown corporation, the Newfoundland Industrial Development Corporation and may take the form of loans against the securities offered by the prospective enterprise, or the acquisition and holding of shares or other securities of any company wherever incorporated, with the right of the enterprise to buy back these shares.
- (3) Buildings, where they exist, and land may be provided on very attractive terms.
- (4) Based on cost-benefit analyses, the government might be willing to subsidize the cost of electric power.
- (5) In two special areas within the province (Stephenville and Bell Island) the Newfoundland Government is prepared, for a period of two years after production commences, to exempt prospective firms from the province's share of the corporation income tax.
- (6) In special instances and in two special areas (Stephenville and Bell Island), the Newfoundland Government is prepared to exempt prospective firms from the provincial sales tax on original machinery, equipment and material used for plant construction or expansion.
- (7) Development operators may be exempted from paying the provincial tax on diesel oil and gasoline used in manufacturing or processing operations.
- (8) Industrial training facilities are available throughout the province for specialized courses to meet the requirements of incoming industry.

Prince Edward Island.—Provincial assistance to manufacturing is generally funnelled through Industrial Enterprises Incorporated (IEI), a Crown corporation of the Prince Edward Island Government. It is prepared to offer assistance to prospective Island industries by way of long-term financing at attractive rates of interest. In addition, IEI assists industries by acting as a clearing house for information regarding alternate sources of credit in financing through other lending institutions or outright grants that may be available from government sources. IEI is also equipped to provide research and management services to existing Island industries or to groups contemplating new projects on the Island.

The Act incorporating IEI is particularly flexible in the terms of reference describing the manner in which IEI may participate financially in assisting industry in the province. Participation is generally by way of a first mortgage on facilities but could well be in the form of an equity position. The ratio of IEI's participation to that contributed by the investors has been very generous in the past and, necessarily, will be negotiated on an individual project basis in the future.

* Prepared by the provincial authorities concerned.

An interesting and efficient machine is used to fold facial tissues in a paper products plant.

Drilling printed wiring boards in a shop that turns out many kinds of telephone equipment.

A large meat-packing establishment produces great quantities of a very popular product.

Workmen building a portion of duct that will feed air into the tail-mounted engine of a jetliner.

Nova Scotia.—The Province of Nova Scotia offers two programs of direct financial assistance to new or expanding manufacturers.

(1) *Industrial Estates Limited* (IEL), a Crown corporation of the province formed in 1957, will finance 100 p.c. of the cost of land and buildings and at least 60 p.c. of the installed cost of machinery and equipment of new or expanding Nova Scotia manufacturers. The terms and conditions of financing made with clients are negotiable. IEL has made special arrangements with most Nova Scotia municipalities whereby the local taxes paid by its clients are limited to 1 p.c. of the building cost for a period of 10 years.

(2) *The Industrial Loan Board* (ILB), affiliated with the Department of Trade and Industry, provides mortgage financing for a wide range of new or expanding manufacturers and processors and, in addition, financing is made available to businesses providing tourist accommodation facilities. Eligible businesses may receive up to 75 p.c. of the cost of land, buildings, equipment, furnishings and other chattels taken as security. The term of loan for industrial enterprises is 15 years and for tourist and accommodation facilities, 20 years.

The special municipal tax assistance, mentioned above, is authorized under the Nova Scotia Bonus Act.

It should be mentioned, in addition, that the Cape Breton Development Corporation, a federal Crown agency, is responsible for fostering greater economic activity in the Cape Breton area of Nova Scotia through the promotion of industries. The program is very flexible and the actual amount of financial assistance that will be provided to any one company or group will depend upon the over-all merits of the individual case. (See Index.)

New Brunswick.—The New Brunswick Department of Economic Growth has the key function of planning, directing and co-ordinating the broad strategy of economic and industrial development activities in the province. This, to a large extent, involves the provision of assistance to encourage existing industry to expand and new industry to establish. In order to carry out this function, the Department consists of three operating Branches.

(1) *The Industrial Finance Board* guarantees the repayment of loans by persons, associations or corporations engaged in industry. Applications are accepted from manufacturers only and the assistance takes the form of a guarantee of a bank loan or bond issue. Loans are to be secured by a first charge on real property, machinery and equipment.

(2) *The Industrial Services Branch* provides support services to industry through two Divisions: the Marketing Services Division complements the work of the federal Department of Industry, Trade and Commerce with a substantial external trade promotion program, including trade fairs and missions, licensing arrangements and assistance in documentation and provides local industry with export opportunities; the Engineering Services Division has the prime responsibility for implementing the government's program of maximizing New Brunswick product content in public construction and the provision of industrial engineering assistance, production control and other engineering services.

(3) *The Development Co-ordination Branch* is responsible for co-ordinating the development efforts of the various provincial departments and agencies. It also acts as the provincial liaison unit with the federal Department of Regional Economic Expansion.

In addition, the New Brunswick Development Corporation, a Crown agency, was established to develop existing and introduce new industry to the province. It is empowered to make loans or guarantees of loans, security being usually taken in the form of a first mortgage. The Corporation must be satisfied that the funds required could not be obtained from conventional sources on reasonable terms and conditions.

A Project Branch undertakes feasibility studies required by industrial principals wishing to establish manufacturing facilities within the province. It investigates, for example, markets, resources, labour, transport, plant location, economic viability, etc., as required. An Engineering Branch advises on all engineering aspects for any new developments and expansion proposals. It has also developed and administers three industrial parks, each of which is set up as a separate company.

Another agency directed toward the economic development of the province is the New Brunswick Research and Productivity Council (see p. 494). The Council is an industrial research and development consulting organization and the source of technical information on processes, machinery, plant, etc., and industrial engineering advice and assistance to local industry. A wide selection of testing and calibration services is provided.

Quebec.—Over the years, the Quebec Government has developed a number of measures intended to give direct stimulation to industrial development in the province; these cover three of the most important aspects of industrial development—capital investment, taxation and grants. The programs under which the government may grant incentives to investment include: aid to regional industrial development; financial aid to selected industries; and financial aid to key industries.

The regional industrial development program applies to all capital investment in manufacturing outside of the industrial area of Montreal. Investment must be for the building or expansion of plant or for the purchase of machines or equipment, and it must be of the order of at least \$50,000. The area eligible for grants under this program is divided into two zones. In Zone I, which is the Montreal area, the grant equals 25 p.c. of capital investment up to \$500,000. In Zone II, which is the remainder of the eligible area, the grant equals 40 p.c. of the first \$250,000 of investment plus 30 p.c. of the next \$750,000 plus 25 p.c. of the remainder, up to a maximum of \$500,000.

The financial aid to selected industries program permits grants to be made to manufacturers investing in certain industrial production equal to 15 p.c. of their investment up to a total of \$500,000. This program applies to the administrative area surrounding Montreal with the exception of a zone some 20 miles wide measured from the centre of the city proper. Conditions of eligibility are based generally on the competitive capacity of the product concerned—one not manufactured in sufficient quantity in Quebec or one destined largely for export. To be eligible, a firm must export one third of the value of production resulting from assisted investment.

The financial aid to key industries program is intended to promote development in Quebec of technologically advanced industries or to promote the manufacture of new products offering some prospect of serving the international market. To be eligible for this assistance, the minimum investment must be \$5,000,000. The amount of the grant is 20 p.c. of the first \$10,000,000 plus 10 p.c. of the remainder; the maximum grant is \$5,000,000. The program applies only to areas not covered by the federal Regional Development Grant Act. A firm benefiting under the program must undertake to spend on research in Quebec during the 10 years following the opening of the plant, an amount at least equal to the grant acquired. Moreover, it must agree to employ, within three years of application, graduates of Quebec universities at the rate of one graduate for every \$50,000 of grant.

Over and above these investment incentive programs, the Quebec Government considers it advisable to grant manufacturing firms a reduction in taxes on profits for their investment in Quebec. Here, too, eligibility is governed by building or expansion of plants or purchase of new machinery and equipment. The taxation easement allows for a reduction in taxable revenue amounting to 30 p.c. of all investment exceeding \$50,000.

The Quebec Government grants industrial credit through the Industrial Credit Board which was set up in 1967. The Board grants loans to new or existing manufacturing enterprises for the purchase of land, for the purchase or construction of buildings and for the purchase of machinery or equipment. It gives credit to small and medium-sized firms at reasonable rates if they are not able to find it elsewhere, provided they show a potential for growth and furnish adequate guarantees.

Ontario.—The Province of Ontario gives direct assistance for industrial expansion and increased trade through the Ontario Development Corporation (ODC), a Crown agency for economic and regional development which is answerable to the Legislature through the Minister of Trade and Development. The ODC program provides interest-

free forgiveable loans; term loans at reasonable rates of interest; technical and advisory services; and rental and leaseback of manufacturing plants in approved areas. Forgiveable loans, generally representing about one third of the total capital requirement, are forgiven over a six-year period as the company meets commitments. Term financing is provided through mortgages, debentures, etc., in many of Ontario's smaller centres of population. Loans may run up to 20 years and are available for construction of new manufacturing buildings or the extension of existing buildings, and for purchase of new manufacturing equipment that will substantially add to employment. The Corporation may also act as a catalyst in arranging financial packages for companies, and will provide advice on obtaining financing from private lenders, government and other sources.

Equalization of Industrial Opportunity (EIO).—Under this program, started in 1967, secondary manufacturing companies establishing new facilities in provincial equalization areas or making approved additions to existing facilities are eligible for EIO loans. The loans are available to companies building new plants and will also apply on new machinery when 75 p.c. of the machinery installed is new.

Northern Ontario Development.—A new Northern Ontario Development Corporation was formed in 1970, offering loan and advisory services. This Corporation is part of a large reorganization of services for northern Ontario.

Trade and Development.—The Trade and Industry Division of the Department of Trade and Development provides advisory services on financial and marketing matters through four Branches: the Industrial Development Branch provides market research information, details of land and building costs, municipal services, energy and labour costs, incorporation and customs laws, material sources, and transportation facilities; the Marketing Branch assists Ontario companies to export by sending trade missions abroad, by bringing in foreign buyers and through educational programs; the Research Branch provides economic studies for the Division and may also undertake short-term research for industry; and the International Branch operates a trade and industry counselling service in 14 world markets—New York, Chicago, Los Angeles, Boston, Atlanta, Cleveland, Minneapolis/St. Paul, London, Frankfurt, Milan, Stockholm, Vienna, Brussels and Tokyo.

The Department of Trade and Development also operates an immigration service to assist Ontario employers seeking staff.

The Sheridan Park Research Community.—The Sheridan Park Corporation has established the Sheridan Park Research Community at Mississauga, which has research laboratories and facilities that offer an interchange of ideas and techniques and help participating companies to stay competitive in world markets. Research creates new and improved products as well as better utilization of natural resources. This unique \$36,000,000 community employs some 1,600 persons in nine resident companies and corporations.

The Ontario Economic Council.—This 20-member advisory group reports to Cabinet on methods to encourage maximum development of human and material resources throughout Ontario. Members of the Council are private citizens who serve without pay. (See Index.)

Manitoba.—The Department of Industry and Commerce, established in 1948, is the focal point of provincial government effort in the drive for economic development in Manitoba. To carry forward a comprehensive range of economic development programs, the Department has established various branches and agencies, using an organizational concept that provides industry specialization combined with comprehensive program support.

The Industry Group consists of five Branches with the specific commodity interests of: Food Products; Chemicals; Machinery and Equipment; Industrial Materials and Services; and Textiles and Consumer Goods. Each is charged with the responsibility of fostering maximum economic growth in its sector, through expansion of existing firms and attraction of new investment. Each has the function of studying trends in its sector,

identifying business opportunities, and assisting firms through market research, business development, trade development and casework. The Programs Group has four Branches directly concerned with the implementation of programs in the areas of economic research, product development, production efficiency, manpower recruitment and regional development.

Some 50 professionals plan and carry out all programs, consulting and engineering services, and research activities. In addition, the Department works closely with other agencies on matters affecting Manitoba's economic development. The following three associated agencies are special-purpose bodies of private citizens supported by Department staff.

The *Manitoba Export Corporation* assists Manitoba firms in developing export sales. It works closely with each industry Branch and is empowered to appoint agents abroad and to handle exports for Manitoba manufacturers. Services include extensive practical advice on pricing documentation, export procedures and tariffs. The Corporation can assume all the duties of an export department for Manitoba companies. The *Manitoba Design Institute* promotes and encourages the application of industrial design principles in Manitoba companies through a series of seminars, workshops, product evaluation sessions, packaging clinics and direct assistance. The *Manitoba Research Council* promotes facilities to enhance the applied research and development capabilities of Manitoba industries; provides information to industry regarding sources of financial assistance for research and development; and works with research units and reference authorities throughout the world to assemble and present the latest in theoretical, technical and practical know-how to Manitoba producers. (See also p. 496.)

The Department of Industry and Commerce has introduced two new programs to provide assistance. The first is the establishment of Industrial Fellowships to stimulate the creation of industrial enterprises and the second is the formation of four committees to help develop centres of excellence in research.

The Manitoba Development Corporation.—This is a Crown corporation established in 1958 to provide financing for new and existing manufacturing and processing industries, for the tourist industry and for community development corporations in the province. In considering applications for financial assistance, the Corporation is influenced mainly by sound business practices and the potential contribution to the economic growth of Manitoba, including the creation of employment opportunities. Given these considerations, loans are usually extended when financing is not otherwise available on reasonable terms and conditions, provided the owner has invested a reasonable amount of capital in the business. The terms of repayment can be tailored to suit the requirements of the individual applicant.

Manitoba Regional Development Corporations.—By Manitoba legislation, enacted in 1964, these essentially autonomous organizations came into being to undertake promotion in a wide sphere of regional interests. They were created to promote industrial, commercial and tourist developments in their respective areas and to respond more effectively to the changes taking place in rural areas. They represent a unique instrument in Manitoba and have proved extremely effective in meeting the challenges of regional development through improved communication with people at the regional level. The Department of Industry and Commerce has encouraged the formation of regional development corporations in Manitoba and the Manitoba Government has contributed to their operating costs. At present, seven regional development corporations, encompassing all of Manitoba except Metropolitan Winnipeg, have been formed.

Manitoba Incentives to Industry.—The Province of Manitoba offers an improved incentives program for Manitoba companies generally engaged in production/processing, distribution or specialized construction. These incentive programs are offered through

the Department of Industry and Commerce to help Manitoba firms pay for growth-plan costs in the following six areas of industrial interest.

- (1) The Feasibility Studies Incentive Program has been established to share the costs incurred by eligible Manitoba companies undertaking feasibility studies to develop plans for company growth and assist in application for new grants offered by the federal Department of Regional Economic Expansion.
- (2) Technical Assistance Incentives are available to aid Manitoba firms to retain private consulting and advisory services, thus permitting Manitoba companies to take advantage of modern management techniques to improve manufacturing productivity, product acceptance and organizational control and efficiency.
- (3) Design Improvement Incentives are available to aid Manitoba firms to retain private consulting and advisory services. The purpose is to assist Manitoba companies with the improvement of market acceptance and competitiveness of existing products, with the creation of profitable new products and generally to improve their competitive position in national and international markets.
- (4) The Research and Development Incentives Program enables eligible Manitoba companies to obtain assistance for product innovation and testing. The objective is to encourage the introduction of new products or a radical improvement of existing products, through research and development.
- (5) The Exports Incentives Program assists eligible Manitoba companies seeking new export markets by participating in defraying the costs incurred in approved advertising, sales promotion or merchandising in new export markets.
- (6) The Manpower Development Incentives Program assists Manitoba companies in the establishment of effective manpower development and training programs for employees, through a sharing of costs incurred for the professional advice necessary to set up such programs.

Saskatchewan.—Assistance to industry in Saskatchewan is given through the Department of Industry and Commerce, the main functions of which are to provide co-ordination for resource industries with all locational factors and problems connected with major resource development; to identify and promote secondary industrial opportunities and provide service to local secondary industry; to promote domestic and export marketing of products produced in Saskatchewan; and to stimulate, co-ordinate and promote the development of tourism in the province. The Department also assists industry by sponsoring or supporting trade shows, industrial seminars and displays of Saskatchewan products at provincial, national and international fairs and exhibitions.

The Industry Incentives Act.—In March 1970, the Saskatchewan Legislature passed the Industry Incentives Act, the purpose of which is to encourage the establishment, expansion and modernization of industry in certain areas of the province. The Act, which is administered by the Department of Industry and Commerce, provides forgivable loans amounting to either \$5,000 for each job created in the operation of the new or expanded facility, 20 p.c. of the capital cost of establishing, expanding or modernizing the facility, or \$300,000, whichever amount is the least. One tenth of the loan will be forgiven each year until the end of the fifth year, when the balance will be forgiven provided the company has performed satisfactorily. Provincial loans will not be made in those areas eligible to receive Federal Government incentive grants.

The Saskatchewan Economic Development Corporation (Sedco).—Assistance to industry is also given by the Saskatchewan Government through the loan program of Sedco, a Crown agency established in 1963. Assistance is intended for primary or secondary manufactures, including certain specialized agricultural businesses. Enterprises may be of any size, they may be local, provincial, national or foreign organizations and ownership may take any form. An industrial enterprise is defined as an industry engaged wholly in extracting or processing natural or mineral resources, but not basic farming operations; a secondary manufacturing industry or one engaged in processing agricultural products; and an industry serving the former or one of service to agriculture. A specialized agricultural operation is one whose investment is centred in fixed assets other than land, such

as in machinery, equipment and buildings. Loans are normally mortgage loans secured by a pledge of the fixed assets of the borrower, repayable for a specific term but, in appropriate circumstances, other forms of financing may be arranged.

In addition to loans, Sedco can provide or arrange to provide industrial sites, buildings and plants on lease, lease-purchase arrangements or by outright sale.

Alberta.—The Province of Alberta assists industry through the services of the Alberta Commercial Corporation, a Crown corporation established in 1964. As a means of further strengthening the industrial base in the province, a program of financial assistance is offered to new incoming manufacturers as well as to the expansion programs of existing Alberta concerns, and financial assistance is provided in various forms to industries unable to obtain suitable financing through other sources.

The assistance is intended primarily for small manufacturers and producers and provides the financing of inventories of raw and/or finished materials, the financing or re-financing of plant equipment, the financing of plant-sites including land and buildings, and, at present on an experimental basis, the provision of leased premises under sub-lease.

Under the banner "Assistance to Industry", the service operates on an assist basis. The company and its principals are expected to lay the financial foundations and the Alberta Commercial Corporation then fills requirements not provided for by the banks or other lending institutions. Inventory financing is usually limited to about 75 p.c. of costs; on loans covering equipment or plant-sites, the level is set to suit the purpose and usually runs to about 60 p.c. Inventory financing lends itself to the broadest application among manufacturers and producers, since most of such industries face inventory problems and, when these are solved, operating capital problems usually disappear. Hence the service provides an alternative to the facilities of other lending institutions. In these specific areas, the Corporation is unique in Alberta.

Under inventory financing contracts, the Corporation actually purchases and stores inventory for resale to the Alberta industries being served and all benefits, such as savings through bulk buying, etc., go to the industries. Equipment and building finance contracts are designed to suit the needs and future planning of the operating company and the periods over which these contracts extend vary in accordance with their respective needs. Repayment is made against a blended schedule of monthly payments allowing the company to budget ahead accordingly.

Service under the program is provided through the Corporation's head office in Edmonton and its southern area office in Calgary. Financing programs are individually dealt with through an experienced staff of professional personnel. Applications for assistance call for suitable back-up material, such as financial statements, etc., which is studied and broadly assessed. Applications are considered for approval by the Board of Directors and, under normal circumstances, funds are scheduled to flow in four to six weeks. All funds employed under the various schemes call for interest at a favourable rate and security is in the form of clear first charges with suitable involvement of the principals and the prudent stabilizing of the company's economic structure for the period of the undertaking.

A further and often equally or even more important function of the Corporation is that of providing guidance to small manufacturers and producers in management problems. Such assistance is usually applied, without cost, with the object of helping the manufacturers lay down strong procedural foundations upon which to build and better attract suitable financing as a result. These operations are directed toward the regular professional counselling services at the earliest suitable moment and as soon as their budgets allow.

The services of the Corporation are continuously examined and updated as a means of keeping all aspects of the program fully abreast of the changing needs of industry.

British Columbia.—The functions of the Department of Industrial Development, Trade, and Commerce are to encourage industry, to extend foreign trade, to investigate matters of economic importance, to collect and publish statistical information, and to assist in regional industrial development. In these fields, the Department is organized to assist existing activities and encourage new enterprises by placing its facilities at their disposal, and to co-operate in all problems incidental to establishment. Direct financial assistance is not provided for manufacturers except for the provision of bounties for the production of blister copper or refined copper (not yet exercised) and a bounty for pig iron of British Columbia origin used for steel-making purposes in the province.

The chief means employed by the British Columbia Government to promote industrial development are: (1) to develop the basic provincial infrastructure, including the extension of rail services to northern centres by the provincially owned Pacific Great Eastern Railway, and to develop electric power facilities by the British Columbia Hydro and Power Authority; (2) to provide economic data and analysis relating to markets, production, wage costs, etc. (a function of the Economics and Statistics Branch of the Department of Industrial Development, Trade, and Commerce); and (3) to assist in locating plant sites.

The Department maintains industrial and trade promotion offices in London, England, and also in San Francisco and Los Angeles.

One man monitors more than 60 varying types of dyeing machines from the central control room. All workers displaced as a result of the new operations were given alternate employment by the company.

The first fully computerized dyehouse of its kind in Canada is on line in the Cowansville, Que., plant of one of the country's largest textile manufacturers. The system, built at a cost of \$1,800,000, controls a greater number of diversified dyeing machines than any other known dyehouse in the world.

A length of freshly dyed fabric is extracted from a dye machine in one of the few manual stages left in the dyeing operation.

CHAPTER XVII.—CAPITAL EXPENDITURES, CONSTRUCTION AND HOUSING*

Subsection 1. Value of Construction Work Performed.....	823	Subsection 2. Housing Activities, 1969-70..	834
Subsection 2. Building Permits Issued.....	828	Subsection 3. Housing Statistics of the 1966 Census.....	839

The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.

This Chapter provides data on the capital expenditures made by all sectors of the Canadian economy on construction and on machinery and equipment, together with summaries of other available statistics for the construction industry. Section 1 shows the amounts spent by each of the various industrial or economic sectors. Section 2 brings together a number of summaries of related series on construction activity—value of work performed by type of structure, value of materials used, salaries and wages paid, numbers employed, and building permits issued. Government aid to house-building, construction of dwelling units and housing statistics of the 1966 Census are covered in Section 3.

Section 1.—Capital Expenditures on Construction and on Machinery and Equipment†

A survey carried out early in 1970 indicated that capital expenditures in Canada by business establishments, institutions, governments and house-builders are expected to reach \$17,865,000,000 during that year. This total represents an increase of about 7 p.c. over the \$16,612,000,000 estimated for 1969. Within the total, outlays for new construction are expected to rise by some 7 p.c. and those for new machinery and equipment by slightly more than 8 p.c. above the comparable 1969 expenditures.

The capital program planned for 1970, if accomplished, would match the estimated increase in investment spending for 1969 and would represent a rising level of activity in

* Except where otherwise noted, prepared (June 1970) in the Business Finance Division, Dominion Bureau of Statistics.

† Capital expenditure figures for 1968 and earlier years are final and those for 1969 are preliminary and subject to revision at a later date. Capital expenditures for 1968 and 1969, as well as intentions for 1970, appear in greater detail in the publication *Private and Public Investment in Canada, Outlook 1970*, available from Information Canada (Catalogue No. 61-205).

volume terms. These increases follow two years of marginal increase in value terms and a decline in the physical volume of investment activity if allowance is made for price increases during the two years. The rate of increase expected in 1970 is similar to the average experienced over the past decade and will provide moderate growth impetus to the economy without placing generally excessive demands on investment supporting activities.

With the exception of housing, planned capital spending for 1970 for all other major sectors of the economy is expected to be higher than the 1969 level. Spending plans of business involve an increase of 11 p.c. and social capital outlays by institutions and governments are expected to rise by 10 p.c. House-building activity, on the other hand, is expected to decline by 5 p.c. following a record year in 1969.

The pattern of investment expenditures expected in 1970 differs considerably from that experienced in 1969. In the latter year, the most buoyant area of investment was house-building which recorded an increase of 20 p.c. Business investment advanced by about 7 p.c. following declines in the previous two years, and capital outlays by governments and institutions were slightly lower than in 1968. Results of the 1970 survey indicate that planned spending for new construction will rise by about 7 p.c. in 1970, with a 5-p.c. decline in residential construction more than offset by a 13-p.c. rise in non-residential construction. Outlays for the acquisition of new machinery and equipment are expected to be 8 p.c. above those of 1969.

The breakdown of capital spending plans for 1970 by region reveals that capital outlays may be above the 1969 level by about 6 p.c. in the Atlantic region, Quebec and British Columbia and by 14 p.c. in Ontario. Outlays in the Prairie region, however, are not expected to exceed those of 1969. Considerable variations exist among the individual provinces of the Atlantic and Prairie regions. Plans for the Atlantic Provinces suggest that there will be a decline in New Brunswick, but an increase of 16 p.c. in Newfoundland and lesser increases in Prince Edward Island and Nova Scotia. Similarly in the Prairie Provinces, an increase of 4 p.c. is planned in Alberta but expenditures in Saskatchewan and Manitoba are expected to decline moderately.

The spending sectors that contribute to the expected strengths and weaknesses vary considerably from region to region. Business investment is expected to increase in all regions except the Prairie Provinces, where a moderate decline may occur. The most rapid growth is expected in Ontario where plans by business show an increase of more than 26 p.c., largely attributable to higher spending on commodity-producing plants, stores and commercial buildings. Business spending is expected to rise in the Atlantic Provinces by 8 p.c., in Quebec by 6 p.c. and in British Columbia by 7 p.c. In the Atlantic Provinces the main area of strength is in primary industry construction and a significant increase is also expected in spending on electric power facilities in Newfoundland and on manufacturing in Nova Scotia. In Quebec, a moderately higher level of spending is expected in most major sectors. In British Columbia, the most important contributor to the added strength is an expanded program in utilities but, with the exception of commercial building, all other major sectors show moderate gains. In the Prairie Provinces, business investment as a whole is likely to be below the level of 1969 with the only major elements of strength occurring in oil and gas developments and manufacturing in Alberta. House-building is likely to decline in Quebec, Ontario and the Prairie Provinces but modest increases are recorded for the Atlantic Provinces and British Columbia.

Social capital outlays are expected to increase in all regions in 1970. The largest increase of 12 p.c. is expected in the Prairie Provinces, followed by increases of about 11 p.c. in British Columbia and of about 10 p.c. in Quebec; moderate advances are also expected for the Atlantic Provinces and Ontario.

It should be noted that, in the smaller provinces in particular, individual projects or special conditions in one industry may have an important bearing on the year-to-year trend in total investment. For example, a decline in planned outlays by the New Brunswick paper industry, where some large projects reached the completion stage, accounts for most of the reduction in that province. On the other hand, the marked increase expected in Newfoundland is largely the result of an expanded program for electric power facilities. It should also be noted that actual outlays in 1970 may differ from the stated intentions as a result of developments occurring as the year progresses.

Table 1 shows the trend in capital spending over the years 1952-70 in both current and constant (1961) dollars. Table 2 gives a summary of capital and repair expenditures by economic sector for 1968-70 and Table 3 contains details of the manufacturing, mining, utilities, trade, institutions, finance and commercial services sectors.

Prince George Industrial Park, one of several being developed along the Pacific Great Eastern Railway in British Columbia. The 65 plants completed or in the planning stage in this area will generate rail traffic and the establishment of warehouse and service industries for customer use. Other industrial parks are under construction at Williams Lake, Mackenzie and Fort Nelson.

¹ Includes privately operated social and welfare institutions.² Mainly expenditures of real estate companies engaged in developing, owning and leasing properties, and may include outlays for multi-purpose developments with such facilities as theatres, stores, hotel accommodation, etc.³ Includes services to business, certain recreational and personal services and such miscellaneous services as trade and exhibition associations.

A summary of the capital expenditures in each province for the years 1968 to 1970 is given in Table 4. Such expenditures represent gross additions to the capital stocks of

the province and are a reflection of economic activity in the area, although the actual production of these assets may generate major employment and income-giving effects in other regions.

4.—Capital and Repair Expenditures, by Province, 1968-70

Section 2.—Construction Statistics

Subsection 1.—Value of Construction Work Performed

Statistics of the construction industry are based largely on information received at the same time and from the same sources as the data on capital expenditures that appear in Section 1. The data represent the estimated total value of all new and repair construction performed by contractors, by labour forces of utility, manufacturing, mining and logging firms, and by government departments, home-owner builders and other persons or firms not primarily engaged in the construction industry. Table 5 shows the value of new and repair construction work performed during the period 1961-69 with intentions for 1970, and Table 6 shows the value of such work performed by contractors and others in the years 1966-70.

5.—Value of New and Repair Construction Work Performed, 1961-70

NOTE.—Actual expenditures 1961-68; preliminary 1969; intentions 1970.

Year	New	Repair	Total	Total Construction as Percentage of Gross National Product
	\$'000,000	\$'000,000	\$'000,000	p.c.
1961.....	5,518	1,456	6,974	17.8
1962.....	5,787	1,509	7,296	17.2
1963.....	6,157	1,559	7,716	17.0
1964.....	7,004	1,630	8,634	17.3
1965.....	8,114	1,754	9,868	18.0
1966.....	9,281	1,954	11,235	18.3
1967.....	9,474	2,146	11,620	17.7
1968.....	9,909	2,305	12,214	17.1

¹ Includes related structures employed in production of petrochemicals.

Principal statistics of the construction industry are shown by province and for contractors, utilities, governments and others in Table 8. The statistics given for Canada as a whole may be considered as relatively accurate but those for individual provinces and by class of builder are approximations only. All estimates given for cost of materials used are based on ratios of this item to total value of work performed, derived from annual surveys of construction work and applied to the total value-of-work figures. Estimates of labour content are similarly based but, in addition, are adjusted to include working owners and partners and their withdrawals. Although the ratios were calculated in some detail by type of industry, still further refinements are required. There are also some difficulties in obtaining the precise location of projects undertaken or to be undertaken by large companies operating in a number of provinces. However, if used with these qualifications in mind, the table provides useful estimates.

8.—Labour Content, Cost of Materials and Value of Work Performed in Construction, by Province and by Employer, 1968-70

NOTE.—Actual expenditures 1968; preliminary 1969; intentions 1970.

Price Index Numbers of Construction and Capital Goods.—Reference is made here to Chapter XXI, Part IV on Prices. Section 2 of that Part contains index numbers which measure price changes in residential and non-residential building materials and changes in construction wage rates; price indexes of highway construction which express prices paid by provincial governments in contracts awarded for highway construction each year as a percentage of prices paid in 1961; and price indexes of electrical utility construction (distribution systems, transmission lines, transformer stations) which provide an estimate of the impact of price change on the cost of materials, labour and equipment used in constructing and equipping such utilities.

Subsection 2.—Building Permits Issued

The estimated value of proposed construction is indicated by the value of building permits issued. Figures of building permits issued are collected from more than 1,400 municipalities across the country and are available for individual municipalities, for metropolitan areas, for provinces and for economic areas in Quebec, Ontario and Manitoba.

The total value of permits issued for building construction in 1969 was \$4,895,551,000, a figure 2.5 p.c. higher than that in 1968. Residential construction values held steady, showing only a 1-p.c. increase and, although non-residential construction values increased by 4.1 p.c., the advance was more than accounted for by increases of 7 p.c. and 20 p.c. in the industrial and commercial sectors, respectively; the institutional and government permit values decreased by 7 p.c. All provinces showed increases in 1969 except Newfoundland, Quebec and Saskatchewan, where the decreases were 19 p.c., 14 p.c. and 32 p.c., respectively. The value of building permits issued in each province in the years 1968 and 1969 is given in Table 9, in each of 50 municipalities in Table 10 and in each of the 19 metropolitan areas in Table 11. The latter made up 68 p.c. of the 1969 total for Canada.

Section 3.—Housing*

Subsection 1.—Government Aid to House-Building

Federal Assistance.—The role of the Federal Government in housing has expanded progressively since the introduction of the first continuing statute in 1935. Although the Government originally entered the housing field in 1918 when it made money available to the provinces for re-lending to municipalities for housing purposes, the first general piece of federal housing legislation was the Dominion Housing Act passed in 1935. This was followed by the National Housing Acts of 1938 and 1944, culminating in 1954 with the present National Housing Act, defined as “an Act to promote the construction of new houses, the repair and modernization of existing houses and the improvement of housing and living conditions”. Central Mortgage and Housing Corporation (CMHC), a Crown

* Prepared (June 1970) in the Information Division, Central Mortgage and Housing Corporation, Ottawa.

agency incorporated by Act of Parliament in 1945, administers the National Housing Act and co-ordinates the activities of the Federal Government in housing. The Corporation has the authority and responsibility for a variety of functions affecting housing in its long-term outlook as well as in its immediate requirements. It is empowered to act as an insurer of mortgage loans, as a lender or investor of public funds, as a guarantor and as an owner of property and other assets. It also acts as a research agency in fields associated with housing and assists provinces and municipalities in many aspects of urban growth. In general, the Government, through the successive Housing Acts, has attempted to stimulate and supplement the market for housing rather than assume direct responsibilities that rightfully belong to other levels of government or that could be borne more effectively by private enterprise. In each case the aim has been to increase the flow of mortgage money and to encourage lenders to make loans on more favourable terms to prospective home owners. Close to half of the country's present stock of approximately 5,900,000 houses have been built since the first covering legislation was enacted; about one third of these were financed in one way or another under the Housing Acts.

Under the terms of the National Housing Act, 1954 and its subsequent amendments, the Federal Government is active in many ways.

Loan Insurance.—Insured mortgage loans may be made for both home-ownership and for rental housing. They are normally available from approved lenders to individual home-owner applicants, to builders constructing houses for sale or for rent and for some special groups, such as co-operative housing associations and farmers. Insured loans are also available for the purchase, improvement, refinancing or sale of existing dwellings.

Prior to June 1969, the maximum interest rate on insured loans was restricted to $2\frac{1}{4}$ p.c. above the long-term Government bond rate adjusted quarterly to the nearest one eighth of one per cent. Amendment to the National Housing Act, approved June 27, 1969, removed this restriction from all but home improvement loans, thus allowing the NHA interest rate to find its own level in relation to the open market.

Upon application, the borrower pays CMHC a fee of \$35 per unit to help defray expenses incurred in the examination of plans and specifications, in the determination of lending values and in compliance inspections during construction. An approved lender requires evidence that a home owner or home purchaser is providing 5 p.c. of the value of the house from his own resources. For the home owner this equity may be in the form of cash or a combination of cash, land and labour; for the home purchaser it may be in cash or labour. The regulations require that gross debt service—the ratio of repayments of principal and interest plus municipal taxes to the income of the borrower—should not exceed 27 p.c., although instances involving higher ratios may be considered on their merits. The borrower pays an insurance fee which is added to the amount of the loan and is repaid over the term of the mortgage; the fee ranges from $\frac{2}{3}$ p.c. to $1\frac{1}{4}$ p.c. of the loan, according to type of unit and time of mortgage advances.

Loans for new home-ownership may be up to 95 p.c. of the first \$20,000 of lending value plus 80 p.c. of the remainder to a maximum loan of \$25,000. For rental housing, loans may be for 90 p.c. of lending value. Loan maxima vary with the type of rental housing but cannot exceed those set for similar dwellings built for home-ownership. Current maxima are: single family units \$25,000; apartment multiple units \$18,000 per unit; and hostels \$7,000 per person accommodated. Loans for existing houses may be 95 p.c. of the lending value, up to a maximum amount of \$18,000 per housing unit. The repayment period may be up to 40 years for new home-ownership, rental housing, and for existing home-owner dwellings.

Direct Loans.—CMHC may make direct loans for both home-ownership and rental housing where, in the opinion of the Corporation, loans are not available through approved lenders. Loans are made to any eligible home-owner applicant but direct loans to builders are normally subject to a requirement that the houses be pre-sold to satisfactory purchasers. By the end of 1970, direct lending by the Corporation totalled approximately \$4,203,397,000.

CMHC may make loans to any organization, corporation or individual to assist in financing the construction of low-rental housing projects or in the purchase of existing buildings and their conversion into low-rental housing projects. In addition to self-contained units, developments undertaken may include hostel or dormitory accommodation for elderly and low-income individuals. Loans may be up to a maximum of 95 p.c. of the lending value established by CMHC. The period for repayment may not exceed the useful life of the project and in any case may not be for more than 50 years. The interest rate is established by Order in Council. Plans and specifications for such projects as well as financing and operating arrangements must be approved by the Corporation.

Since December 1960, the National Housing Act has provided financial assistance for the elimination or prevention of water and soil pollution. CMHC is authorized to make a loan to a province, municipality or a municipal sewerage corporation for the purpose of assisting in the construction or expansion of a sewage treatment project. The loan may not exceed two thirds of the cost of the project and the maximum repayment term is 50 years from date of completion. The interest rate is prescribed by the Governor in Council. The agreement covering the project contains a condition whereby 25 p.c. of the loan principal and 25 p.c. of the accrued interest will be forgiven for projects completed to the satisfaction of CMHC on or before Mar. 31, 1975. Where construction is not completed before that date, 25 p.c. of the loan advanced or warrantable by construction progress at that date, plus 25 p.c. of the accrued interest on advances, may be forgiven.

Long-term loans are available to a province or its agency, a municipality or its agency, a hospital, a school board, a university or college, a co-operative association or a charitable corporation for the purpose of assisting in the construction of a student housing project, or the acquisition of existing buildings and their conversion into a student housing project. In all cases, the government of the province concerned must approve the loan. CMHC may lend up to 90 p.c. of the project cost, subject to maximum amounts as follows: \$25,000 per new unit; \$18,000 per self-contained unit or existing housing unit, and \$7,000 per person housed in dormitory or hostel accommodation. The term of the loan may not exceed 50 years. The interest rate is prescribed by the Governor in Council.

Guarantees.—CMHC is authorized to give a limited guarantee to banks or approved instalment credit agencies in return for an insurance fee paid by the borrower on loans made for additions, repairs and alterations to existing houses and apartments. A home improvement loan and the balance owing on any existing NHA home improvement loan on the property may not exceed \$4,000 for a one-family dwelling or \$4,000 for the first unit of a duplex, semi-detached or multiple-family dwelling, plus \$1,500 for each additional unit. Loans are repayable in monthly instalments over a period not exceeding 10 years. The maximum rate of interest is restricted to $2\frac{1}{4}$ p.c. above the long-term Government bond rate adjusted quarterly to the nearest one eighth of one per cent.

Public Housing.—Under the National Housing Act and complementary provincial legislation, the Federal Government and the government of a province may enter into a partnership agreement to build rental housing for families and individuals of low income or to purchase and rehabilitate existing housing for this purpose. Projects may include hostel or dormitory accommodation in addition to self-contained units. The Federal Government

pays up to 75 p.c. of the capital costs and the provincial government the remainder, although the latter may call upon the municipality concerned to bear a portion of the provincial share. Rents for units in federal-provincial projects are related to the tenant's family income and size of family. Operating deficits are shared on the same contractual basis as the capital costs.

As an alternative method of producing public housing, the CMHC is empowered to make long-term loans to a province, or to a municipality or public housing agency with the approval of the province, for the provision of housing accommodation. Projects may consist of new construction or existing buildings and include dormitory and hostel accommodation as well as self-contained family units. Loans may be up to 90 p.c. of the total costs as determined by CMHC and for a term as long as 50 years but not in excess of the useful life of the development. The maximum that may be borrowed for a fully serviced apartment is \$18,000, and for hostels or dormitories \$7,000 for each person accommodated. For a house, the maximum is \$25,000. The interest rate is set by the Governor in Council. Where this alternative is selected, federal grants may be made covering up to 50 p.c. of losses incurred in the operation of public housing projects, for a period of up to 50 years but not exceeding the useful life of the project.

Urban Renewal.—Federal grants and loans are available under the Act to assist provinces and municipalities undertaking programs of urban renewal. CMHC, with Federal Government approval, may arrange with a municipality to undertake a study to identify blighted areas, determine housing requirements and provide data upon which an orderly program of conservation, rehabilitation and redevelopment can be based. The federal contribution may be as much as 75 p.c. of the cost. The legislation also authorizes federal contributions equal to one half of the costs of preparing an urban renewal scheme setting out proposals for urban renewal action, a similar cost-sharing arrangement for the implementation of a scheme, and loans up to two thirds of the provincial or municipal share of the cost of carrying out an urban renewal scheme. Loans may be for 15 years at an interest rate prescribed by the Governor in Council. To encourage the improvement and conservation of housing meeting minimum standards of construction, loans are available for the sale, purchase or refinancing of existing housing in urban renewal areas not designated for demolition.

Activity under the urban renewal provisions of the National Housing Act was restricted in 1969 following the report of the Task Force on Housing and Urban Development. The report expressed strong reservations about existing approaches to urban renewal and made specific recommendations for the future. As a result of this report, an in-depth study was undertaken with a view to formulating a new federal policy for urban assistance. Preliminary findings indicated that, in the next decade, urban assistance would be based on very different principles to those used in the past. In August, a suspension of federal approval of new projects was put into effect. As an interim measure negotiations were undertaken to permit at least partial implementation of a small number of projects.

Land Assembly.—The Federal Government and the government of a province may enter into an agreement to provide for a land assembly project which involves the development of raw land for housing purposes. The Federal Government pays up to 75 p.c. of the cost and the provincial government the remainder. The latter may call upon the municipality concerned to bear a portion of the provincial share. In addition, loans equal to 90 p.c. of the cost of assembling and servicing land for public housing or general housing purposes are available at a preferential interest rate to provinces, municipalities and their agencies.

CMHC Building.—The Corporation may construct and administer housing and certain other buildings on its own account and for other government departments and agencies. Its responsibilities include the provision of architectural and engineering designs, the calling of public tenders and the administration of construction contracts—including any necessary on-site surveying and engineering. On such contracts, the Corporation carries out full architectural and engineering inspections.

Research.—CMHC is concerned with building technology in the formulation of standards for housing construction, in the use of suitable materials and in the development of new building techniques. The Corporation has no laboratory facilities but has direct experience of performance in the field and seeks the advice of specialists in various agencies and departments of the Federal Government in such matters. Research into the factors affecting housing is concerned with the measurement of the demand for new housing, the volume of new housing built and the supply of mortgage money for house construction. The Corporation also co-ordinates and publishes statistical information on housing. Funds provided under the National Housing Act support the activities of the Canadian Housing Design Council, the Community Planning Association of Canada and the Canadian Council on Urban and Regional Research.

Other Federal Legislation.—The Farm Credit Act, 1959 provides for federal long-term loan assistance for housing as well as for other farm purposes (see pp. 561-562); the Veterans' Land Act, 1942 provides a form of loan and grant assistance to veterans for housing and other purposes (see p. 409); and the Farm Improvement Loans Act, 1944 (see pp. 559-560) provides for guarantees for intermediate- and short-term loans made by approved lending agencies to farmers for housing and other purposes. These three statutes are concerned only incidentally with housing.

Provincial Assistance.—All provinces have complementary legislation providing for joint federal-provincial housing and land assembly projects and, in addition, most provinces have enacted separate legislation with respect to housing. Details of such assistance may be secured from the provincial government departments listed in the Directory of Sources of Official Information included in Chapter XXVII under the heading of "Housing".

Subsection 2.—Housing Activities, 1969-70

During 1969, housing starts totalled 210,415 dwelling units, 6.9 p.c. above the previous record of 196,878 established in 1968. Completions also increased to a record level of 195,826 units from 170,993 in the previous year. Dwellings under construction at year-end rose from 126,638 to 137,357. Apart from the production of self-contained housing units, hostel accommodation was provided for more than 19,000 persons, mainly the elderly and students. Investment in housing was also at a record level of \$3,400,000,000, an increase of 18.6 p.c. over 1968.

Housing for low-income groups made a significant advance in 1969 as a result of Government policy which directed the principal federal effort into this field. Of the 210,415 starts during the year, just over 28,000 were under NHA rental programs for low-income families, including students; this compared with 13,800 in 1968 and 10,300 in 1967. This policy continued into 1970 and, for this purpose, two thirds of the federal housing budget of \$854,000,000 was allocated to housing for low-income families, elderly people, students and handicapped individuals; it is estimated that this amount will support the provision of about 35,000 units.

Two factors dominated house-building activity during 1969. Massive injection of mortgage funds from both public and private sources in the last few months of 1968 and

in early 1969 resulted in record seasonally adjusted start rates of 267,300 and 215,500 units per year for the first and second quarters of 1969. The second factor, which emerged during the latter half of the year, was the effect of the high and rising level of interest rates on the supply of mortgage funds with its resultant decrease in house-building activity. The latter circumstance had the effect of reducing the annual rate of starts to 186,000 by the end of 1969.

The same situation continued into 1970 with further drops in the annual rate to a low of 161,600 unit starts in February. Starting in March, increases were recorded which, although modest, appeared to be consistent with the trend in private institutional lending, indicating that building activity in the latter part of 1970 might compensate in part for the low start rate experienced in the first half of the year. In actual terms, starts in urban areas during the first four months of 1970 totalled 29,272, a decrease of 41 p.c. from the total of 49,499 for the same period of 1968. This was equivalent to a seasonally adjusted annual rate of 166,600 units for all areas in Canada.

Operations under the National Housing Act.—NHA mortgage loans amounting to \$1,197,228,000 were approved in 1969 for the provision of 79,868 new units and 17,235 hostel beds, compared with loans of \$1,242,055,000 approved for 86,641 new dwellings and 14,119 hostel beds in 1968. Direct lending by CMHC for the second consecutive year was below the volume of insured loans by approved lenders operating under the Act; loans by the federal agency had a value of \$546,938,000 against \$650,290,000 for approved lenders.

Loans made available through private lenders in 1969 amounted to \$700,621,000 for 48,695 dwellings. Trust companies remained the largest source of private funds, approving loans for 16,833 units; insurance company loans represented 9,059 dwellings; and chartered bank loans amounted to \$234,151,000, representing 14,944 units.

Borrower and House Characteristics.—The average income of purchasers of NHA-financed houses in 1969 was \$9,385 or, in terms of family income, \$10,810. These incomes were 6.6 p.c. higher than the corresponding averages for purchasers in 1968 and appeared to be in line with the general increase in incomes in 1969. As in previous years, relatively few purchasers of NHA houses were drawn from the lower third of the range of family incomes. In 1969 only 0.1 p.c. of the borrowers had family incomes of less than \$5,000 as compared with 1.4 p.c. in 1967.

The average age of purchasers of NHA houses was about 33 years in 1969, a slight decrease from earlier years. In 1969 just over one half of the purchasers had two or more children and 27.6 p.c. had previously been home owners.

The average price of NHA-financed houses purchased in 1969, including many started in the previous year, was \$20,831. On these houses, purchasers provided down-payments averaging \$3,903 and undertook monthly payments of \$190.76 for mortgage principal, interest and taxes. Compared with 1968, these represented increases of 2.8 p.c. in price and 20.3 p.c. in monthly charges and a decrease of 14.2 p.c. in down-payment. The proportion of monthly charges to income increased from 21.8 p.c. to 22.6 p.c.

As in other years, most of the NHA-financed single-detached houses purchased in 1969 were bungalows, which type represented 72.4 p.c. of the total compared with 75.6 p.c. in 1968. The proportion of split-level dwellings increased from 18.4 p.c. to 21.1 p.c. and that of two-storey dwellings from 5.4 p.c. to 6.0 p.c. Of these dwellings about 84 p.c. had three bedrooms and the remainder had four or more.

Loans for Low-Rental Housing.—In 1969, loans amounting to a total of \$444,835,000 were approved to assist in the construction of 28,040 self-contained units of low-rental housing and hostel accommodation for 19,211 persons.

Loans for Student Housing Projects.—Loans totalling \$67,812,000 were approved in 1969 for 58 student housing projects, involving the construction of 1,601 self-contained units, 8,897 hostel beds, and the purchase and conversion of existing buildings to provide a further 23 units and 806 beds. Comparable figures for 1968 were 1,115 new units, 8,833 new hostel beds and conversion of existing buildings to provide 167 units and 988 beds.

¹ No loans were approved for student housing projects in Newfoundland or the Yukon and Northwest Territories.

From December 1960, when student housing loans were first authorized, to December 1969, 289 totalling \$361,631,000 were approved involving the construction of 4,785 units and 56,986 beds, and the acquisition and conversion of existing buildings to provide 256 units and 2,705 beds. The statutory limit that may be advanced for such loans is \$550,000,000.

*Loans for Municipal Sewage-Treatment Projects.**—During 1969, 147 loans amounting to over \$50,913,000 were authorized to assist municipalities to undertake sewage-treatment projects, distributed provincially as follows:—

<i>Province*</i>	<i>Loans</i>	<i>Amount</i>	<i>Province</i>	<i>Loans</i>	<i>Amount</i>
	No.	\$'000		No.	\$'000
Newfoundland.....	—	—	Ontario.....	50	20,305
Prince Edward Island...	2	58	Manitoba.....	3	721
Nova Scotia.....	16	1,165	Saskatchewan.....	12	2,571
New Brunswick.....	5	2,887	Alberta.....	15	3,469
Quebec.....	29	8,323	British Columbia.....	15	11,414

From December 1960, when assistance for sewage-treatment projects was authorized, to December 1969, 1,523 loans totalling \$322,578,000 were approved.

Mortgage Marketing.—Sales of NHA-insured mortgages amounted to \$127,600,000 in 1969 compared with \$43,000,000 in 1968. Because of heavy pressure on the market for long-term funds, auctions were not held by the Corporation between 1966 and 1969; total sales by the Corporation to the end of 1965 totalled \$308,600,000.

Urban Renewal.—As indicated in Subsection 1, p. 833, activity under the urban renewal provisions of the National Housing Act was restricted in 1969. During the year, the Corporation approved contributions totalling \$117,000 to four municipalities to undertake urban renewal studies—two in Ontario and two in Quebec. In 1968, 46 grants totalling \$879,000 were approved for such studies.

Federal contributions totalling \$496,000 were approved during 1969 for the preparation of 26 urban renewal schemes, all in the Province of Quebec. Also, 20 schemes were approved for implementation supported by a federal contribution of \$17,991,000. Together, these involved the rehabilitation of 1,097 acres and the displacement of 948 families, and the estimated total cost was \$45,249,000. Locations and acreages were: 13 in Quebec involving a gross of 1,000 acres; four in Ontario of 62 acres, and three in British Columbia of 53 acres. By far the largest in size was the St. Maurice project in Thetford Mines, Que. It will in-

* Provincial data are gross; all others are net

volve the redevelopment of 739 acres and a federal contribution estimated at \$2,750,000 with a loan to assist in the implementation of a further \$1,833,000.

Public Housing.—During 1969, approval was given for 41 federal-provincial housing projects—11 in Nova Scotia, 20 in Saskatchewan, five in Alberta, two in British Columbia and three in the Northwest Territories. These projects will provide 1,070 dwellings and the federal contribution will be \$12,400,000. To the end of 1969, approval had been given for 16,869 rental units under federal-provincial arrangements. Of these, 14,429 are to be subsidized at rents related to the income of tenants and the remainder will be leased at fixed rents related to dwelling size and at levels sufficient to recover capital costs and to meet operating expenses. The federal 75-p.c. share of the deficit of the subsidized units in 1968, paid in 1969, was \$6,400,000.

Under arrangements with the Provinces of Nova Scotia and Prince Edward Island, assistance may be given under the National Housing Act for co-operative house-building. In 1969, projects were approved for 1,049 units in Nova Scotia, bringing the total approved since the inception of the program in 1953 to 2,637 units. Since 1960, 152 units have been approved in Prince Edward Island.

In April 1965, agreement was reached between the Federal Government and the Province of Saskatchewan for a joint program to provide housing for metis and enfranchised Indians in sparsely settled regions of northern Saskatchewan. During 1969, 74 units were approved, bringing to 168 the total number approved under this experimental program. The units are located at Air Ronge, Beauval, Buffalo Narrows, Cumberland House, Green Lake, Île à la Crosse, La Loche, Turnor Lake, Dore Lake, Pelican Narrows, Pine House, and St. Walburg. The federal contribution for 1969 was \$265,000. Similar agreements have been reached with the Provinces of Manitoba and Alberta directed primarily to people of Indian origin.

Loan-Assisted Projects.—In 1969, 208 loans amounting to \$196,862,000 were approved for 16,027 units: 75 in two projects in Newfoundland, 52 in three projects in Nova Scotia, 384 in 13 projects in New Brunswick, 4,132 in 44 projects in Quebec, 11,054 in 140 projects in Ontario, 76 in two projects in Manitoba, and 342 in six projects in Alberta. The estimated annual 50-p.c. federal contribution toward operating losses for the projects was \$6,200,000.

Land Assembly.—Under the federal-provincial arrangements, six land assembly projects for 816 residential building lots were approved in 1967, located in Campbellton, New Brunswick; Aurora and Wallaceburg, Ontario; and Ladysmith, Masset and Sparwood, British Columbia. During 1968, 1,381 lots were approved for development and approval was also given for the acquisition and ultimate development for housing purposes of 4,685 acres of land. In 1969, 14 loans were approved, amounting to \$7,551,000, to assist in the acquisition of land for future housing purposes. These were located in Corner Brook, Newfoundland; Halifax, Lower Sackville, North Preston, Port Hawkesbury and Sydney, Nova Scotia; Hearst, Kenora, Oakville, Pembroke, Waterloo Township and Woodstock, Ontario; and Edmonton and Redwater, Alberta. By far the largest project is in Edmonton. It involves a loan of \$4,541,000 for the acquisition of 3,500 acres.

Subsection 3.—Housing Statistics of the 1966 Census

Because of the abbreviated nature of the 1966 Census, only two housing questions were included in the questionnaire, one relating to structural type of dwelling and the other to tenure. Tables 16 and 17 provide a 1961-to-1966 comparison of structural type and tenure of occupied dwellings for the provinces and the Census Metropolitan Areas.

Data relating to specific housing characteristics are summarized for 1951 and 1961 in the 1967 Year Book at pp. 728-729 and are detailed in Vol. II (Part 2) of the 1961 Census (Catalogue Nos. 93-523 to 93-534). Housing data in similar detail will be available from the 1971 Census.

Section 1.—The Government in Relation to Labour

Subsection 1.—The Canada Department of Labour and the Federal Department of Manpower and Immigration

The Canada Department of Labour

The Canada Department of Labour was established in 1900 under the Conciliation Act which provided machinery to aid in preventing and settling labour disputes and required the Department to collect, compile and publish statistical and other relevant information. The Department also assumed the administration of the Fair Wages Policy adopted in the same year for the protection of workmen employed in the execution of Federal Government contracts and on works aided by grants from public funds. Since that time the Department has been charged with the administration of new legislation and has taken on new functions. Its work fell broadly into two main areas—industrial relations and manpower supply—until Jan. 1, 1966, when all manpower activities were transferred to a new Department of Manpower and Immigration (see p. 843).

The legislation now administered by the Canada Department of Labour in the industrial relations area applies to employers, workers and trade unions under federal jurisdiction. The Department is responsible for conciliation procedures in industrial disputes, the investigation of complaints of unfair labour practices, refusals to bargain and violations of legislation, the processing of applications for the certification and decertification of trade unions and the conducting of representation votes. It determines wage rates and hours of work in Federal Government contracts for construction or supplies, and promotes joint labour-management consultation. It also administers legislation to prevent discrimination

* Except as otherwise noted, this Chapter has been revised under the direction of the Deputy Minister of the Canada Department of Labour, Ottawa.

in employment based on race, religion, colour or national origin and to provide for equal pay for female employees. In 1965, the Canada Labour (Standards) Code became law. The Code establishes minimum standards of wages, hours of work, vacations with pay and paid general holidays in industries under federal jurisdiction. To ensure safe working conditions for all employees in industries and undertakings coming under federal jurisdiction, the Canada Labour (Safety) Code was passed by Parliament at the end of 1966 and was proclaimed in effect Jan. 1, 1968.

Since 1917, the Canada Department of Labour has encouraged and assisted in the establishment of labour-management committees in industry and services. With considerable expansion in this work in 1966, the service was reorganized and became a separate Branch of the Department, namely, the Labour-Management Consultation Branch. There are now 2,663 (March 1970) active committees whose efforts are directed to such subjects as improving work methods, safety, operating efficiency, plant maintenance, eliminating waste, maintaining good morale, promoting educational and training activities, and joint consultation on operational changes brought about by technological change.

Research, involving regular and special surveys and analyses of economic and social trends affecting the labour force, is an important part of the Department's work carried out by the Economics and Research Branch. It studies wages and working conditions, union organization, collective bargaining, industrial relations, labour standards and safety. Through the Women's Bureau, it investigates the problems of women in the labour force. It operates a plan of workmen's compensation for seamen on Canadian ships and arranges workmen's compensation for Federal Government employees. In addition to the publication of statistical reports and the results of research studies, the Department publishes the monthly *Labour Gazette*, maintains records of labour legislation in the provinces and in other countries, operates a labour lending library and provides liaison between the International Labour Organization and the federal and provincial governments.

The Department of Manpower and Immigration*

The fundamental purpose of the Department of Manpower and Immigration is to further the growth of Canada through effective allocation and development of manpower resources in response to the changing needs of the national economy. The Department uses two main channels to ensure that the supply of qualified manpower is adequate to meet the demands of the labour market: (1) counselling, placement and, where necessary, training and relocation of workers, and (2) introduction of new manpower through immigration.

Operations Canada.—"Operations Canada" distinguishes the Department's domestic field activities from those at head office and at offices abroad; it comprises five regional headquarters, some 360 Canada Manpower Centres and 90 Canada Immigration Centres. Regional Directors-General, responsible for both manpower and immigration activities in the field, report to the Assistant Deputy Minister, Operations, at head office.

The objectives of Operations Canada are: (1) to provide, through strategically located Canada Manpower Centres, the facilities for an effective employment service for both workers and employers; (2) to help workers utilize their maximum potential through counselling or referral to manpower development programs and obtain jobs which match their skills, capabilities and needs; (3) to assist employers in the recruitment of skilled workers, and offer advice in their manpower planning by providing up-to-date occupational and labour market information; (4) to help workers adapt to economic and technological change by encouraging employers and workers to co-operatively pre-plan, and through the use of departmental training and mobility programs; (5) to provide services for the reception, settlement and job placement of immigrants; and (6) to process international travellers and enforce the Immigration Act and Regulations within Canada, providing facilities to process applications by Canadians wishing to sponsor or nominate relatives.

* Prepared by the Information Service, Department of Manpower and Immigration, Ottawa.

In the 12-month period ended Mar. 31, 1970, Canada Manpower Centres assisted some 723,000 persons, excluding casual workers, to find gainful employment, and referred more than 312,000 clients to full or part-time upgrading or skill-development training courses under the Canada Manpower Training Program. In the same period, some 15,000 handicapped clients were referred to federal-provincial rehabilitation assistance programs, and more than 49,500 workers and trainees received moving and transportation assistance under the Canada Manpower Mobility Program.

Manpower Division.—Under the Assistant Deputy Minister, Manpower, this Division provides functional support for the manpower areas of Operations Canada; it consists of three units—the Activities Development Branch, the Manpower Utilization Branch and the Programs Branch.

The Activities Development Branch deals with the demand side of the labour market, providing guidelines in the following main areas: development and utilization of departmental services for employers; specialized information on industrial needs; and organization of Canada Manpower Centres to give effective employment service to employers. It also directs the operations of the Manpower Consultative Service which administers Federal Government assistance to industries undergoing manpower dislocations resulting from technological and other changes.

The Manpower Utilization Branch is concerned with the supply side of the labour market. It formulates policies and guidelines for the provision of employment services to workers and promotes the use of Canada Manpower Centres; develops aptitude and achievement tests for use in counselling and selection; advises on methods of matching jobs and workers; and advises on the manpower utilization of special groups such as youths, handicapped persons, immigrants, migrants and indigenous people. The Branch administers the Vocational Rehabilitation of Disabled Persons Act under which the Federal Government shares equally with participating provinces in the costs of vocational rehabilitation services to disabled persons, and the Operation Retrieval program which is designed to put Canadian employers interested in hiring new university graduates in touch with Canadians studying abroad. The Branch carries on a continuing educational program designed to create a more favourable employment climate for middle-aged and older workers, as well as a program to facilitate and encourage the employment of high school and university students during the summer months.

The Programs Branch deals with the major programs that facilitate the matching of labour market supply and demand. It administers the Canada Manpower Training Program which provides for the training or retraining of adults in schools and industry, and the Canada Manpower Mobility Program which facilitates the movement of workers to areas of job opportunity.

Immigration Division.—Under the Assistant Deputy Minister, Immigration, the Home Service Branch of the Division provides procedural guidelines for field operations in Canada relating to admission of immigrants and non-immigrants, apprehension of persons who contravene Canadian laws after being admitted or gaining illegal entry, and removal from the country of those liable to deportation.

Subsection 2.—Federal Labour Legislation and Provincial Labour Legislation

Federal Labour Legislation*

Fair Wages Policy.—The Fair Wages Policy applying to all Federal Government contracts was first set forth in a Resolution of the House of Commons (1900) and later incorporated in an Order in Council and amended from time to time. Wages and hours

* The Act establishing the Canada Labour (Safety) Code (SC 1966-67, c. 62), proclaimed in effect Jan. 1, 1968, provides for the consolidation, under the title "Canada Labour Code", of the Acts described under this heading, with the exception of the Fair Wages and Hours of Labour Act and the Fair Wages Policy Order.

on contracts for construction are now regulated by the Fair Wages and Hours of Labour Act (RSC 1952, c. 108), as amended by an Act to amend the Fair Wages and Hours of Labour Act, effective Apr. 1, 1967 (RSC 1967, c. 24), and by the Fair Wages and Hours of Labour Regulations. Hours of work on construction contracts are limited to eight a day and 48 a week, except in exceptional circumstances approved by the Minister or in such cases as the Governor in Council may prescribe; hours worked in excess of eight in a day or 40 in a week must be paid for at an overtime rate at least equal to one and one half times the rates required under the contract; wages to be paid are those current for the type of work in the district or, if there are no current rates, fair and reasonable rates as determined by the Minister of Labour; in no case shall the rates be less than the minimum hourly rate prescribed by or pursuant to the Canada Labour (Standards) Code.

Wages and hours of work on contracts for equipment and supplies are regulated by Order in Council PC 1954-2029. The hours of such work must be those fixed by the custom of the trade in the district where the work is performed, or fair and reasonable hours. The wages must be current or fair and reasonable but in no event shall they be less than those established by statute or regulation of the province in which the work is being performed.

The Fair Wages and Hours of Labour Regulations and Order in Council PC 1954-2029 both contain a clause prohibiting discrimination against any person in matters of employment because of that person's race, national origin, colour or religion, or because he has made a complaint or given information with respect to such alleged discrimination.

The Industrial Relations and Disputes Investigation Act.—This legislation came into effect by proclamation on Sept. 1, 1948, revoking the Wartime Labour Relations Regulations in effect since March 1944 and repealing the Industrial Disputes Investigation Act which had been in force from 1907 until suspended by the Wartime Regulations in 1944. The Act protects proceedings commenced and decisions, orders and certifications made under the wartime legislation in so far as these involve services authorized by the Act.

The Act applies only to industries within federal jurisdiction, viz., navigation, shipping, interprovincial railways, canals, telegraphs, steamship lines and ferries, both international and interprovincial, aerodromes and air transportation, radio broadcasting stations, and works declared by Parliament to be for the general advantage of Canada or of two or more provinces. However, the Act provides that provincial authorities if they so desire may enact similar legislation for application to employees within provincial jurisdiction and make mutually satisfactory arrangements with the Federal Government for the administration of such legislation by the federal authorities.

In general, the Act in its important features provides that employees and employers shall have the right to organize and bargain collectively and that trade unions may be certified as bargaining agents for employee groups. Trade unions and employers are required, upon notice, to bargain collectively in good faith. The Act provides for invoking collective bargaining negotiations and for the mediation of conciliation officers and conciliation boards in reaching collective agreements. Employees may change bargaining agents at times under conditions specified in the Act, which also prescribes conditions affecting the duration and renewal of collective agreements. Collective agreements are required to contain provision for the arbitration of disputes concerning the meaning or violation of such agreements and, where such provision is lacking, application may be made for its establishment. The Act prohibits unfair labour practices, i.e., the interference with or domination of trade unions by employers or interference, discrimination and coercion in trade union activity. The conditions that must be observed prior to strike and lockout action are set down in the Act. Industrial inquiry commissions may be appointed to investigate industrial matters or disputes. The Minister of Labour is charged with the administration of the Act and is directly responsible for the provisions affecting the appointment of conciliation officers, conciliation boards, industrial inquiry commissions, consent to prosecute, and complaints that the Act has been violated or that a party has failed to

bargain in good faith. The Canada Labour Relations Board administers provisions concerning the certification of bargaining agents and the writing of a procedure into a collective agreement for the final settlement of disputes concerning the meaning or violation of such agreement.

Detailed statistics concerning activities under the Act may be found in the Annual Report of the Canada Department of Labour.

Canada Fair Employment Practices Act.—This Act, which came into effect on July 1, 1953, prohibits discrimination in employment based on race, colour, religion or national origin. It applies only to industries within federal jurisdiction—those covered by the Industrial Relations and Disputes Investigation Act (see above). This law prohibits acts of discrimination by employers; discrimination by trade unions in regard to membership or employment; the use by employers of employment agencies that practise discrimination; and the use of advertisements or inquiries in connection with employment that express, directly or indirectly, any limitation, specification or preference as to race, colour, religion or national origin.

Female Employees Equal Pay Act.—This Act came into effect on Oct. 1, 1956 and applies to employers and employees engaged in works, undertakings or businesses coming within federal jurisdiction. The Act, in its principal provision, prohibits an employer from employing a female for any work at a rate of pay that is less than the rate at which a male is employed by that employer for identical or substantially identical work.

Canada Labour (Standards) Code.—This Act received Royal Assent on Mar. 18, 1965 when the administration and general provisions of Part V came into effect. The Act provides, in Parts I to IV which came into force on July 1, 1965, minimum standards with respect to hours of work, minimum wages, annual vacations and general holidays in industries under federal jurisdiction; the Annual Vacations Act 1958 was repealed.

The standard hours of work are eight a day and 40 a week, with maximum hours of 48 a week. Overtime pay at not less than time-and-one-half is required for all hours worked in excess of the standard hours. Permits are required in order to work more than 48 hours a week. Where the nature of the work necessitates irregular distribution of hours of work, the hours may be averaged over a period of two weeks or more.

The minimum wage is \$1.65 an hour for all persons 17 years of age or over and the minimum wage for persons under 17 years of age is \$1.40 an hour. Special rates may be set for persons receiving on-the-job training and for disabled or handicapped persons.

Employees are entitled to a two-week vacation with pay after one year of employment, with vacation pay calculated at 4 p.c. of wages. The general holidays are eight in number and every employee is entitled to a holiday with pay on each of them, or substitutes for them. Pursuant to an amendment to Part IV of the Code, the Multi-employer Employment (Longshoring) Regulations have been passed to provide for the granting of pay in lieu of general holidays to longshoremen in multi-employer employment who previously could not qualify for general holiday benefits because they did not have sufficient employment with one employer.

The Code has special and transitional provisions. Any person may make a submission (under Sect. 51) for deferment or suspension of Part I (Hours of Work). The Minister may grant deferment or suspension where it can be shown that the application of Part I is or would be prejudicial to the interests of the employees or detrimental to the operation of the business. The Minister's order to defer or suspend may be for a period up to but not exceeding 18 months from the date of the order, and the order may or may not contain conditions on hours. A further deferment or suspension may be made by the Governor in Council but only after there has been an inquiry, and the order of the Governor in Council must contain conditions on hours of work. Regulations have been enacted to carry out the purposes of the Code.

Canada Labour (Safety) Code.—This Code, which received Royal Assent in late 1966 and was proclaimed in effect as of Jan. 1, 1968, is the first general safety legislation to be passed by the Parliament of Canada. Its primary purpose is to ensure safe working conditions for all employees in industries and undertakings under federal jurisdiction. The main features of the Code are that: (1) it provides for all the elements of a complete industrial safety program; (2) it sets out the general obligation of employers and employees to carry out their duties in a safe manner and authorizes the making of regulations for dealing with problems of occupational safety; (3) it does not override but complements other federal laws and provincial legislation, thus strengthening the safety movement; (4) it authorizes the use of advisory committees and special task forces to assist in developing the program, all to be done under continuous consultation among federal and provincial government departments, industry and organized labour; and (5) it provides for research into causes and prevention of accidents and for an extended program of safety education.

Provincial Labour Legislation

Because of the authority given by the British North America Act to the provincial legislatures to make laws in relation to local works and undertakings and in relation to property and civil rights in the province, power to enact labour legislation is largely the prerogative of the provinces. Since it imposes conditions on the rights of the employer and employee to enter into a contract of employment, labour legislation is, generally speaking, law in relation to civil rights. Under this authority, the provincial legislatures have enacted a large body of legislation affecting the employment relationship in such fields as working hours, minimum wages, the physical conditions of workplaces, apprenticeship and training, wage payment and wage collection, labour-management relations, workmen's compensation and other matters. In each province a department of labour or department of labour laws. Legislation for the protection of miners is administered by departments dealing with mines. The workmen's compensation law in each province is administered by a workmen's compensation board appointed by the Lieutenant-Governor in Council.

Minimum Wages.—As a means of ensuring adequate living standards for workers, all provinces have enacted minimum wage legislation. These laws vest in a minimum-wage-fixing board or the Lieutenant-Governor in Council authority to establish minimum wages for employees. In most provinces, minimum wage orders now cover almost all employment except farm labour and domestic service. Minimum rates set by the orders apply throughout the province except in Nova Scotia, Quebec and Saskatchewan. Both Nova Scotia and Quebec are divided into two zones for minimum wage-setting purposes. In Saskatchewan, minimum rates vary between urban and rural areas. Except in Newfoundland, Nova Scotia and Prince Edward Island, the same rates are set for both sexes.

Hours of Work.—Five provinces have general hours-of-work laws. Those of Ontario, Alberta and British Columbia set limits on daily and weekly hours of work. Hours are limited in Alberta and British Columbia to eight a day and 44 a week, and in Ontario to eight a day and 48 a week. The Ontario Act requires, with some exceptions, that one and one half times the regular rate be paid for work done, under permit, beyond the 48-hour limit. The Manitoba and Saskatchewan Acts do not limit daily and weekly hours but require the payment of one and one half times the regular rate if work is continued after specified limits. The Manitoba law requires payment of the overtime rate after eight and 48 hours for men and eight and 44 hours for women. The Saskatchewan Act requires payment of the overtime rate after eight and 44 hours. Some exceptions are provided for in all five Acts.

Regulation of Wages and Hours in Certain Industries. Apart from general hours-of-work laws, other statutes regulate working hours in some industries. Industrial standards legislation is in effect in Newfoundland, Prince Edward Island, Nova Scotia,

New Brunswick, Ontario, Saskatchewan and Alberta. These laws provide that a schedule of wage rates and hours of work agreed upon by a representative group of employees and employers in an industry or trade may, upon approval by the government, be given statutory effect by Order in Council, with the result that such wage rates and hours become the minimum terms of employment for the entire industry or trade in the area. An advisory committee, usually equally representative of employers and employees, is established to assist in enforcing a schedule. This legislation is used fairly extensively in the building trades, the clothing industries, barbering and a few other industries. In Newfoundland, Nova Scotia and New Brunswick, schedules have been issued only for certain construction trades in some areas. In Ontario, schedules for the garment trades, the fur industry and the hard furniture industry apply throughout the province and a substantial number of schedules apply to various construction trades and to barbering in specified areas.

Under the Quebec Collective Agreement Decrees Act, certain terms of a collective agreement, including those dealing with hours and wages, may be made binding on all employers and employees in the industry concerned in a defined area, provided the parties to the agreement represent a sufficient proportion of the industry. The standards made binding under this procedure are contained in a decree, which has the force of law. Approximately 85 decrees applying to the garment trades, barbering and hairdressing, commercial establishments, garages and service stations, and other industries and services are in effect. Of these decrees, 14 apply throughout the province. Working conditions in the construction industry are governed by decrees under a separate Act, the Construction Industry Labour Relations Act, 1968.

The Construction Industry Wages Act in Manitoba, which applies to both private and public construction work, provides for the setting of minimum rates of wages and maximum hours of work at regular rates for employees in the construction industry, on the recommendations of a board equally representative of employers and employees, with a public member as chairman. Under this Act, annual schedules set the regular work week and hourly rates of wages for various classifications of workers in the heavy construction industry, in the Greater Winnipeg building construction industry, and in rural building construction.

Annual Vacations and Public Holidays.—All provinces have annual vacations legislation applicable to most industries. In Prince Edward Island and New Brunswick, workers are entitled to a vacation of one week after a year of service; in Ontario, workers are entitled to a vacation of one week after each of the first three years of employment, and of two weeks after the fourth and each subsequent year. In Nova Scotia, Quebec, Newfoundland and the four western provinces, the annual paid vacation required by law is two weeks after a year of service and, in Saskatchewan, three weeks after five years of service.

Six provinces—Alberta, British Columbia, Manitoba, Nova Scotia, Ontario and Saskatchewan—have enacted legislation of general application dealing with public holidays. The number of holidays named varies from five to eight, and the provisions for payment also vary.

Anti-discrimination Laws.—All provinces have adopted fair employment practices laws forbidding discrimination in hiring and conditions of employment and in trade union membership on grounds of race, colour, religion or national origin, and on grounds of social origin in Newfoundland and Quebec, and political opinion in Newfoundland. The British Columbia, Newfoundland and Quebec Acts also forbid discrimination in these areas on grounds of sex. In addition, in British Columbia, Ontario and Newfoundland, discrimination in employment and trade union membership on grounds of age is prohibited. Nine provinces have provisions in separate equal pay Acts or in human rights or labour standards legislation that forbid discrimination in rates of pay solely on the basis of sex. Quebec does not have equal pay legislation but, as indicated above, forbids discrimination in employment on the basis of sex.

Accident Prevention.—Factory or industrial safety Acts in most provinces establish safeguards for the protection of the health and safety of workers in factories and other workplaces with respect to such matters as sanitation, hearing, lighting, ventilation and the guarding of dangerous machinery. Long-established laws regulating the design, construction, installation and operation of mechanical equipment, such as boilers and pressure vessels, elevators and lifts and electrical installations, have been revised in recent years in line with technological changes, and legal standards have been set in new fields involving hazards to workers and the public, such as the use of gas- and oil-burning equipment. This legislation also prescribes standards of qualification for workers who install, operate or service such equipment. Laws requiring safety standards to be observed in construction and excavation work are in force in most provinces.

Labour Relations.—In all provinces, there is legislation similar in principle to the federal Industrial Relations and Disputes Investigation Act, designed to establish harmonious relations between employers and employees and to facilitate the settlement of industrial disputes. These laws guarantee freedom of association and the right to organize, establish machinery (labour relations boards or other administrative machinery) for the certification of a trade union as the exclusive bargaining agent of an appropriate unit of employees, and require an employer to bargain with the certified trade union representing his employees. Except in Saskatchewan, the laws require the parties to comply with the conciliation or mediation procedures laid down in the legislation before a strike or lockout may legally take place, and they also provide that every collective agreement must contain provisions for the settlement of disputes arising out of the agreement, and prohibit strikes and lockouts while an agreement is in effect. All prohibit defined unfair labour practices and prescribe penalties. In most provinces, certain classes of employees who are engaged in essential services, such as policemen and firemen, are forbidden to strike and, in lieu of the right to strike, have recourse to final and binding arbitration. There are provisions relating to hospital disputes in six provinces.

Certification of Qualified Tradesmen.—All provinces have apprenticeship laws providing for an organized procedure of on-the-job training and school instruction in designated skilled trades, and statutory provision is made in most provinces for the issuing of certificates of qualification, on application, to qualified tradesmen in certain trades. In some provinces, legislation is in effect making it mandatory for certain classes of tradesmen to hold a certificate of competency.

Changes in 1969.*—In the field of *labour relations*, amendments to the Quebec Labour Code in 1969 set a precedent in the administration of labour relations in North America. The Quebec Labour Relations Board was abolished and its functions assigned to civil servants (designated as investigators and investigation commissioners acting under the authority of a chief investigation commissioner, all of whom are officials of the Department of Labour and Manpower) and a Labour Court. The role of the investigator, which is mainly administrative, is to issue certification in clear-cut cases; the investigation commissioners handle the more complex cases and make extensive inquiries. The Labour Court has exclusive and final jurisdiction to hear appeal cases arising out of the decisions of the investigation commissioners. In addition, all penal prosecutions under the Code must, in the first instance, be tried in the Labour Court. Another amendment to the Code removed "recognized" associations from the protection of the Code, thus permitting only certified unions to make binding collective agreements.

The Quebec Construction Industry Labour Relations Act, in force from Dec. 18, 1968, established a collective bargaining system adapted to the particular needs of the industry. Certification was abolished. Associations of employers and employees recognized by the Act as representative are now required to negotiate a collective agreement leading to the adoption of a decree that will determine working conditions. Bargaining is conducted by region for the entire industry.

* For 1969 changes in workmen's compensation legislation, see p. 852.

Several provinces enacted or amended labour relations legislation in the public sector. In New Brunswick, the Public Service Labour Relations Act, which went into effect on Dec. 1, 1969, gave public servants collective bargaining rights, including the right to strike. Nova Scotia brought municipal policemen under the Trade Union Act, and Ontario made binding arbitration procedures governing hospital employees applicable to a wider range of institutions, such as nursing homes.

Amendments were made to several *minimum wage* Acts and the general minimum wage rates in six provinces were increased. New Brunswick brought part-time employees within the scope of the Minimum Wage Act. Prince Edward Island amended the definition of "wages" in its Minimum Wage Acts to exclude tips. Saskatchewan deleted from its legislation the section setting out the criteria to be followed by the Minimum Wage Board in establishing the minimum wage; only the Manitoba and Quebec Acts now contain any such criteria.

The highest general minimum wage rates set in 1969 were provided for in Alberta: \$1.40 an hour, effective Apr. 1, 1970, and \$1.55 an hour, effective Oct. 1, 1970.

The minimum rates in effect on July 1, 1970, for experienced adult workers in certain cities are shown in Table 1.

Newfoundland enacted *annual vacations* legislation—the Annual Vacations with Pay Act—requiring employers to grant their employees a vacation with pay of at least two weeks after every completed year of employment, provided the employee has worked at least 90 p.c. of the regular working hours in any continuous 12-month period. Vacation pay is 4 p.c. of total wages for the year. A new *weekly rest* law in Newfoundland—the Weekly Day of Rest Act—stipulates that employees must be granted a rest period of at least 24 consecutive hours in every seven days, wherever possible on Sunday. One month's notice of

termination of employment is required of both employers and employees under another 1969 enactment in Newfoundland—the Employment (Notice of Termination) Act.

Newfoundland also adopted its first *anti-discrimination* legislation, a comprehensive Human Rights Code (to come into effect on proclamation) dealing with public accommodation, fair employment practices (including trade union membership) and equal pay. Discrimination is prohibited on the usual grounds of race, religion, religious creed, colour or ethnic or national origin, with the addition of public opinion and social origin. In employment and trade union membership, discrimination is also prohibited on grounds of sex and on grounds of age (between 45 and 65). Under the equal pay provisions of the Code, a female employee must be paid at the same rate of pay as a male employee for the same work done in the same establishment.

In British Columbia, the Acts relating to fair employment practices, fair accommodation practices and equal pay were embodied in one statute—the Human Rights Act—and a Human Rights Commission was established to assist in the enforcement of the Act. The new Act removed the exemption of employers with fewer than five employees and added sex as a ground of discrimination which is prohibited in employment, or in conditions of employment, and in trade union membership. The Nova Scotia Human Rights Act was revised extensively and strengthened, and the equal pay provisions were removed and enacted as a separate Act.

Under a new Manpower Vocational Training and Qualification Act in Quebec, discrimination is forbidden, with some qualifications, on grounds of race, sex, religion, national extraction or ethnic origin in selecting candidates for apprenticeship or vocational training, in carrying out such training programs, or in examinations for certificates of qualification.

In the *industrial safety* field, Newfoundland enacted an Elevators Act requiring annual inspection and prior approval of plans for installation and major alteration of elevators and other lifting devices within the jurisdiction of the province. British Columbia completely revised its Coal Mines Act in the light of modern techniques. In Nova Scotia, the Workmen's Compensation Board assumed responsibility for accident prevention, replacing an employers' association.

Comprehensive new accident prevention regulations were issued in Newfoundland, Saskatchewan and Alberta by the Workmen's Compensation Boards, and industrial safety regulations were issued by the Nova Scotia Department of Labour under the Industrial Safety Act.

Several provinces also revised safety regulations applying in specific industries and trades, notably in construction in Nova Scotia and Ontario. Revised regulations under the Ontario Construction Safety Act went into effect on July 22, 1969.

Workmen's Compensation.—In all provinces legislation is in force providing for payment of compensation to workmen who are injured by accident arising out of and in the course of their employment or who are disabled as a result of a specified industrial disease. To be entitled to benefits, a workman must be employed in an industry covered by the Act at the time of the injury. Compensation is not payable, however, where the disability lasts less than a stated number of days (varying from one to four in the provincial Acts), or if the injury is due to the workman's own misconduct. A workman who is entitled to compensation has no right of action against his employer for injury sustained during employment.

The Acts provide for a compulsory system of collective liability on the part of employers. Industries covered are divided into classes or groups, according to hazard. Employers are required to contribute to the Accident Fund at a rate fixed in accordance with the accident experience of the class or group. Each class is liable for the costs of all accidents occurring in that class.

The laws apply to enumerated employments but the range of industries covered by each Act is very wide. The principal exceptions are farm workers (who are not covered except in Ontario), domestic servants, casual workers, employees of financial, insurance

and professional undertakings, employees of non-profit religious or charitable organizations, and workers in certain service industries in most provinces, for example, barber shops and beauty parlours. Small undertakings, i.e., those with fewer than a specified number of employees, are exempted from the Act in some provinces. Excluded employments may generally be brought under the Act on the voluntary application of the employer.

Benefits for disability are based on 75 p.c. of earnings, subject to an annual ceiling. Where disability is permanent, a life pension is paid, irrespective of future earnings. Medical benefits are provided without limitation, regardless of a waiting period, and rehabilitation services are available where necessary. Where death results from an employment injury, fixed monthly payments are made to dependants.

A federal Act provides for compensation for accidents to Federal Government employees according to the scale of benefits provided by the Act of the province in which the employee is usually employed. Seamen who are not under a provincial Workmen's Compensation Act are entitled to compensation under the federal Merchant Seamen Compensation Act.

Changes in 1969.—Amendments were made to nine of the provincial Workmen's Compensation Acts. One of the most significant developments was that Quebec became the second province, after British Columbia, to tie compensation benefits to the cost of living. As of Jan. 1, 1970, death and disability benefits are to be adjusted yearly in accordance with the increase in the pension index established under the Quebec Pension Plan.

The maximum annual earnings on which compensation may be paid was raised from \$5,000 to \$6,000 in Newfoundland and Prince Edward Island, from \$5,500 to \$6,000 in New Brunswick, and from \$5,600 to \$6,600 in Alberta. The waiting period was reduced from three days to one day in Quebec.

In Ontario and Alberta, a minimum pension of \$175 a month was established for workers who become permanently and totally disabled. The increased rate (in Ontario, from \$150 a month or earnings, if less, subject to a minimum of \$100 on earnings; in Alberta, from \$35 a week or earnings, if less) was made applicable to pensions already being paid as well as to those payable in the future.

The minimum weekly payment for temporary total disability was increased by \$5 in New Brunswick and Alberta (to \$30 and \$40, respectively) and by \$10 in Ontario and Manitoba (to \$40 and \$35, respectively). In British Columbia, as a result of the rise in the consumer price index in 1968, the minimum weekly payment for temporary total disability was increased, beginning Jan. 1, 1969, by 4.04 p.c. to \$33.78, or average earnings if less, from a minimum in 1968 of \$32.47. Three provinces—Prince Edward Island, Quebec and Alberta—amended provisions dealing with benefits payable in case of a recurrence of disability from a compensable accident.

Dependants' allowances in British Columbia were increased, in line with a rise in the cost of living index, by 4.04 p.c., effective Jan. 1, 1969. A number of other provinces increased benefits payable to dependent widows and children.

New groups of workers brought under the Acts of several provinces included: hospital workers in Prince Edward Island; employees of taverns and lounges in Nova Scotia; the fishing industry and also persons assisting a peace officer in making an arrest or in preserving the peace in New Brunswick; deep-sea fishing enterprises and some coastal fishermen in Quebec, and workers engaged in janitorial services as a business in Alberta.

Section 2.—The Labour Force*

Since 1946, reliable information for analysis of employment in Canada, at the national level and for the five major regions, has been provided through a labour force survey. Between November 1945 and November 1952, quarterly surveys were undertaken and since then the survey has been carried out on a monthly basis. The sample used in the survey

* Prepared in the Special Surveys Division, Dominion Bureau of Statistics.

has been designed to represent all persons in the population, 14 years of age or over, residing in Canada, with the exception of residents of the Yukon and Northwest Territories, Indians living on reserves, inmates of institutions and members of the Armed Forces. Interviews are carried out in approximately 30,000 households chosen by area sampling methods across the country.*

In the labour force survey, persons are classified on the basis of their activity during the week prior to the survey interview week. This week is called the reference week. The main divisions in the classification are:—

Labour Force.—The civilian labour force is composed of that portion of the civilian non-institutional population, 14 years of age or over who, during the reference week, were employed or unemployed.

Employed.—The employed include all persons who, during the reference week: (a) did any work for pay or profit; (b) did any work which contributed to the running of a farm or business operated by a related member of the household; (c) had a job, but were not at work, because of bad weather, illness, industrial dispute or vacation, or because they were taking time off for other reasons. Persons who had jobs but did not work during the reference week and who also looked for work are included in the unemployed as persons without work and seeking work.

Unemployed.—The unemployed include all persons who, through the reference week: (a) were without work and seeking work, i.e., did not work during the reference week and were looking for work, or would have been looking for work except that they were temporarily ill, were on indefinite or prolonged layoff, or believed no suitable work was available in the community; (b) were temporarily laid off for the full week, i.e., were waiting to be called back to a job from which they had been laid off for less than 30 days.

Not in the Labour Force.—Those not in the labour force include all civilians 14 years of age or over (exclusive of institutional population) who are not classified as employed or unemployed. This category includes those: going to school; keeping house; too old or otherwise unable to work; and voluntarily idle or retired. Housewives, students and others who worked part-time are classified as employed or, if they looked for work, as unemployed.

The estimates derived from the labour force survey, which are based on a sample of households, are subject to sampling error. Somewhat different figures might be obtained if a complete census were taken and this difference is called the sampling error of the estimates. In the design and processing of the labour force survey, extensive efforts are made to minimize the sampling error; in general, the percentage of error tends to decrease as the size of the estimate increases. A statistical measure of the sampling error is given in DBS monthly publication *The Labour Force* (Catalogue No. 71-001).

The Labour Force, 1970.—Data for the first nine months of 1970 indicate an increase in the Canadian labour force of 2.4 p.c. to a level of 8,372,000, compared with the same period in 1969. This increase consisted of a 3.2-p.c. (82,000) rise in female participants and a 2.0-p.c. (112,000) increase for males. The over-all participation rate, which is the ratio of the labour force to the population of working age (14+ years), remained at about the same record high level achieved in 1969. Employment rose by 86,000 (1.1 p.c.) to 7,871,000 as the result of a 2.3-p.c. (58,000) increase among females employed and a 0.5-p.c. (28,000) increase among males. Of the industry divisions, service registered the largest gain (5.2 p.c. or 124,000) and agriculture and manufacturing the largest declines (4.9 p.c. or 27,000 and 1.6 p.c. or 30,000, respectively). Regionally, most of the increases of employed occurred in Ontario (53,000) and British Columbia (21,000). Total unemployment rose by 107,000 to 500,000 over the same period a year earlier. Of this total, females unemployed increased by 24,000 to 119,000 and males unemployed increased by 83,000 to 381,000. All of the regions except the Atlantic, which reported no change, showed substantial increases in the number of unemployed. The national unemployment rate, at 6.0, for the first nine months of 1970 was up from the level of 4.8 recorded for the same period in 1969.

* A comprehensive description of the survey is given in DBS publication *Canadian Labour Force Survey—Methodology* (Catalogue No. 71-504).

Characteristics of the Civilian Labour Force, 1960-69.—The period 1960-69 was characterized by rapid expansion of the Canadian labour force, which increased by 1,750,000 or 27.3 p.c. The greatest rise took place in the last five years of the period, when the annual rate of increase averaged 3.3 p.c. During the decade, the number of women in the labour force increased by 945,000 or 57.0 p.c., an advance that was greater, both absolutely and relatively, than the increase of 806,000 or 17.0 p.c. experienced by men. The participation rate reached a record high of 55.8 in 1969 because of the increased participation of women and despite the continued decline of male participation rate which reached a record low of 76.6 compared with the 1960 level of 80.7. This decline can be attributed largely to reduced participation among younger and older men; the rate for those in the 14-19 age group dropped from 42.9 to 37.9, for those in the 20-24 age group from 91.1 to 84.2, and those in the 65 or over group from 30.3 to 23.6. These declines were caused primarily by two factors—the increase in the number of young men delaying their entrance into the labour force by acquiring additional years of education, and the increased use of both government and private pension plans which tend to remove the former delay of retirement caused by financial need.

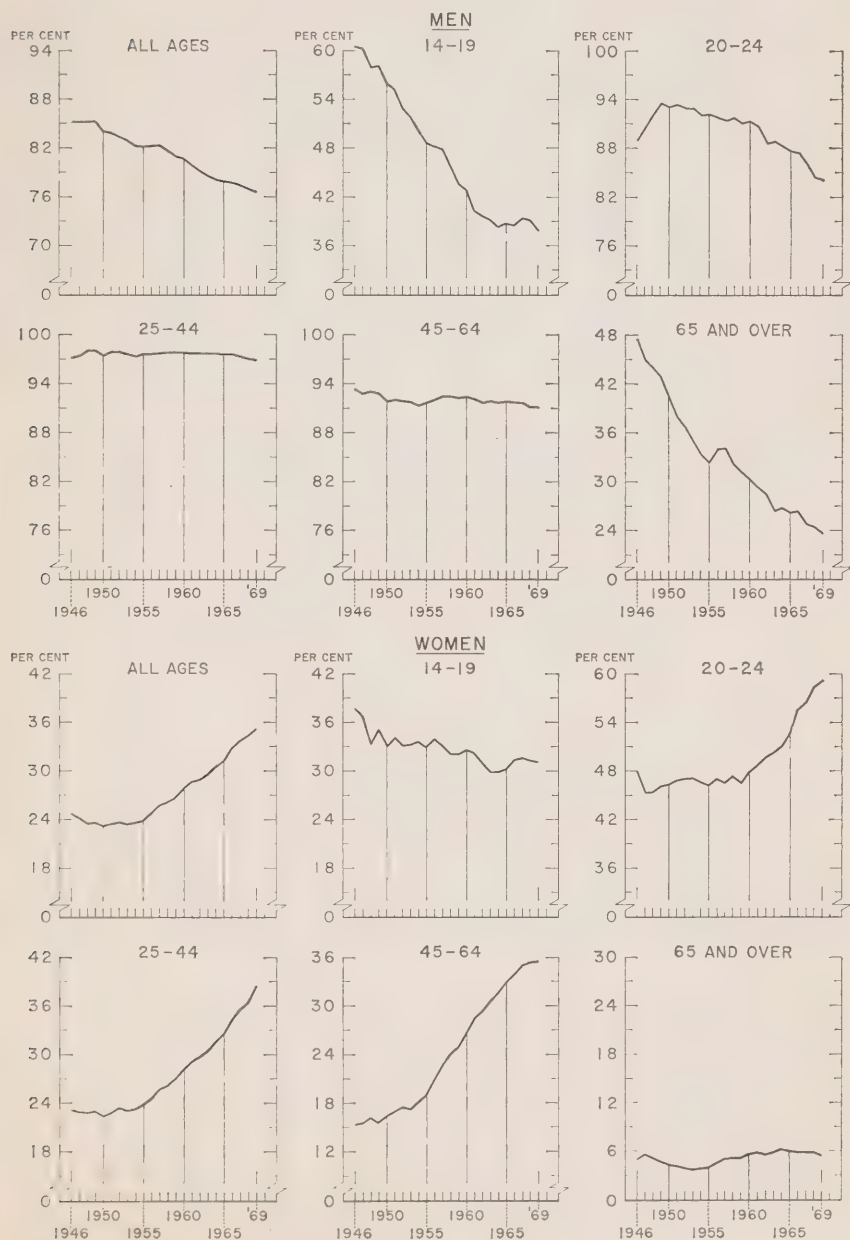

As already stated, the decline of the male participation rate was more than offset during the 1960-69 decade by a strong increase in the female rate, which rose from 27.9 to 35.2. Increases occurred in all age groups from 20 to 64; the rate for women in the 20-24 age group rose from 48.0 to 59.3, for those in the 25-44 age group from 28.4 to 38.5, and for those in the 45-64 group from 26.6 to 35.5. This increase was very largely attributable to the greater number of married women remaining in or re-entering the labour force; in 1969, 56 p.c. of the female labour force was married compared with 45 p.c. a decade earlier. The participation rate for married women rose during that period from 19.1 to 31.2.

Total employment in 1969 was higher than in 1960 by 1,815,000, or 30.4 p.c.; male employment increased by 904,000 or 20.7 p.c., and female employment by 911,000 or 57.0 p.c. All regions of the country shared in the increase. The gain in the Atlantic region was 23.0 p.c., in Quebec 30.1 p.c., in Ontario 30.5 p.c., in the Prairie region 22.7 p.c., and in British Columbia 54.1 p.c.

In 1961, two new systems of coding industry and occupation data were introduced—the 1960 standard industrial classification and the 1961 Census occupational classification. Data prior to 1961 were coded according to the old classification system and are therefore not comparable; for this reason, Tables 4 and 5 cover only the period 1961 to 1969. The most notable features concerning the changes in the distribution of employment by industrial group (Table 4) during the 1961-69 period were the tremendous growth of the service industries whose share of the employed rose from 25.3 p.c. to 30.7 p.c. (an actual growth of 858,000 or 56 p.c.), and the decline in the share of the employed held by agriculture from 11.2 p.c. to 6.9 p.c. (an actual decline of 146,000 or 21 p.c.). These trends are confirmed by the occupation data of Table 5, which shows that the proportion of professional and technical employed rose from 9.9 p.c. to 13.3 p.c. during the period, service and recreation employed increased from 10.9 p.c. to 12.0 p.c., while farmers and farm workers declined from 11.3 p.c. to 6.9 p.c.

There was an uneven regional pattern of unemployment levels throughout the 1960-69 decade. Expressed as a percentage of the labour force, unemployment in the Atlantic region, Quebec and British Columbia was consistently above the national average, while in Ontario and the Prairie region, unemployment rates were lower. In 1969, the average national unemployment rate was 4.7 and the rates for the regions were: Atlantic 7.5, Quebec 6.9, Ontario 3.1, Prairie 2.9, and British Columbia 5.0. Unemployment in Canada during the 1960-69 decade followed a cyclical pattern. The rate of 7.0 in 1960 increased to 7.1 in 1961, declined steadily from 1962 to 1966 to a low of 3.6, and after 1966 increased to the 1969 level of 4.7. The average unemployment rate for the 10-year period was 5.1.

Section 3.—Employment Statistics*

Subsection 1.—Statistics of Employment, Earnings and Hours

Monthly records of employment have been collected from larger business establishments since 1921. At that time a survey was instituted to provide employment index numbers which would serve as current economic indicators. In 1941 the survey was extended to provide information on payrolls and per capita wages and salaries and in 1944 it was further extended to provide data on hours of work and hourly and weekly wages. Also during the war period, separate records for men and women employees were established. Beginning with the January 1966 issues of *Employment and Average Weekly Wages and Salaries* and *Man-Hours and Hourly Earnings*, the data compiled are on a revised basis. A historical series (Catalogue No. 72-504) provides, on the revised basis, monthly and annual data from 1961-65. The revision has involved the publishing of employment indexes on the time base 1961=100 in place of the time base 1949=100. All data are compiled on the 1960 standard industrial classification.

The survey now covers sectors of the following major industry divisions: forestry; mining (including milling); manufacturing; construction; transportation, communication and other utilities; trade; and finance, insurance and real estate. Also included are certain branches of the service industry, mainly hotels and restaurants, laundries and dry-cleaning plants, and recreational and business services. The survey excludes agriculture, public administration and community services such as health and education. The coverage corresponds closely, therefore, to the business sector of the economy. Since the survey covers only firms employing 20 or more persons in any month of the year and excludes several industries, the employment records are published in the form of index numbers.

The monthly employment statistics relate to the number of employees drawing pay in the last pay period in the month. Data are requested for all classes of employees with the exception of homeworkers and casual employees working less than one day in the pay period. Owners and firm members are also excluded. The respondents report the gross wages and salaries paid in the last pay period in the month, before deductions are made for income tax, unemployment insurance, etc. The reported payrolls represent gross remuneration for services rendered and paid absences in the period specified, including salaries, commissions, piece-work and time-work payments, and such items as shift premiums and regularly paid production, and incentive and cost-of-living bonuses. The statistics on

* Prepared in the Employment Section, Labour Division, Dominion Bureau of Statistics.

hours relate to the straight and overtime hours worked by those wage-earners for whom records of hours are maintained, and also to hours credited to wage-earners absent on paid leave during the reported period. If the reported period exceeds one week, the payroll and hours data are reduced to weekly equivalents.

Employment.—Table 7 shows that, over the 1965-69 period, the industrial composite index of employment rose by 11.0 p.c. Each sector except forestry contributed to the advance: service increased by 36.5 p.c., trade by 19.5 p.c., finance, insurance and real estate by 19.0 p.c., manufacturing by 6.8 p.c., transportation by 6.8 p.c., mining by 2.7 p.c. and construction by less than 1 p.c. The decline in forestry amounted to 14.8 p.c. Compared with 1968, the 1969 composite index moved up 3.4 p.c.

7.—Annual Average Index Numbers of Employment, by Industrial Division, 1965-69, and Monthly Indexes 1969

NOTE.—These indexes are calculated as at the last pay period of each month, on the base 1961=100.

Weekly Wages and Salaries.—Average weekly wages and salaries have increased substantially in the years for which current payroll statistics have been collected, rising from \$23.44 in 1939 to \$109.88 in 1968 and \$117.79 in 1969. The upward movement gained momentum after the end of the War and average annual increases from 1946 to 1952 were more than double those between 1939 and 1946. After 1952 the rate of increase, in terms of year-to-year percentage changes, fell slightly, particularly between 1959 and 1962 when average earnings rose about 3 p.c. per annum. In the following years the rate increased moderately—earnings in 1968 were 7.0 p.c. higher than in 1967 and 7.2 p.c. higher in 1969 than in 1968.

¹ Mainly hotels, restaurants, laundries, dry-cleaning establishments and recreational and business services.

Hours and Earnings of Hourly Rated Wage-Earners.—The monthly survey of employment and payrolls covers statistics of hours of work and paid absence of those wage-earners for whom records of hours are maintained, together with the corresponding totals of gross wages paid. These wage-earners are mainly hourly rated production workers; information on hours is frequently not kept by employers for ancillary workers nor, in many industries and establishments, for any wage-earners. Salaried employees are excluded by definition from the series. As a result of these exclusions, data are available for fewer industries and workers than are covered in the employment and average weekly wage and salary statistics.

During the period 1965-69, there was little change in average weekly hours but average hourly and weekly wages rose substantially. For the most part, upward wage-rate revisions in all industries were responsible for the increases. Technological changes, which in many cases involve the employment of more highly skilled workers at the expense of those in the lower-paid occupations, also contributed to the advance of average hourly earnings. From 1965 to 1969, average weekly wages rose 28.5 p.c. in manufacturing, 32.1 p.c. in mining and 40.5 p.c. in construction. Average hourly earnings increased 31.6 p.c. in manufacturing, 35.0 p.c. in mining and 46.6 p.c. in construction. In construction, 1969 average hourly earnings of \$3.71 and average weekly wages of \$147.68 represented increases of 11.4 p.c. and 9.5 p.c., respectively, over the 1968 levels.

¹ Durable goods manufacturing includes wood products, furniture and fixtures, primary metal industries, metal fabricating industries, machinery (except electrical), transportation equipment, electrical products and non-metallic mineral products; non-durable goods manufacturing includes all other manufacturing industries.

Subsection 2.—Earnings and Hours of Work in Manufacturing*

Since 1946 an annual survey of earnings and hours of work in manufacturing has been conducted using (since 1948) the last week of October as the survey week. Information is collected during this normal or representative working week of the year, following generally the same concepts, definitions and coverage as in the larger establishment monthly employment survey. If strikes or other unusual working conditions distort the norm for

* More detailed information is given in DBS annual report *Earnings and Hours of Work in Manufacturing* (Catalogue No. 72-204).

The number of women employed in all industries in Canada rose from 1,911,000 in 1964 to 2,508,000 in 1969. In the later year, more than one out of three women in the country were in the labour force and over half of them were under 35 years of age.

The largest number of women workers, over 1,300,000, were in clerical, service and recreation occupations and 436,000, including teachers and skilled technicians, were in the professional and technical category.

this week, a more suitable week is substituted. Over the whole period, earnings and hours of work in manufacturing have been reported by sex and category and, since 1951, figures have been available for clerical and related workers as distinct from other salaried employees. In addition, the distribution of employees by weekly earnings has been collected periodically since 1950 and the distribution of wage-earners by hours worked or paid for was collected each year from 1946 to 1949 and periodically thereafter.

Tables 15 and 16 give figures for 1963-68. It should be noted that in 1963 there was a break in continuity with previous years. The new establishment concept introduced in 1961 drew into the manufacturing universe some activity reports, such as sales branches, which formerly reported to other industries; these are now coded to manufacturing when they form part of an establishment, the principal activity of which is manufacturing. The survey was not carried out in 1961 and 1962 and revised figures are available only from 1963. The 1960 standard industrial classification is used in Tables 17 and 18.

15.—Average Earnings of Male and Female Employees in Manufacturing, Survey Week 1963-68, and Percentage Increases over Previous Year

NOTE.—Survey week is the last week of October. This survey was not conducted in 1961 and 1962 (see p. 867).

¹ The durable group includes wood products, furniture and fixtures, primary metal industries, metal fabricating industries, machinery (except electrical), transportation equipment, electrical products and non-metallic mineral products; the non-durable group includes all other manufacturing industries.

Subsection 3.—Estimates of Employment*

Estimates of employees by province and industry are produced by adding together data from the long-standing employment and earnings survey of larger establishments, from a sample survey of smaller establishments, and from special surveys in the non-commercial sector. These estimates are available from 1961 on a monthly basis.

The estimates of employees are more reliable indicators of changes in total employment than the large-establishment employment indexes released in the publication *Employment and Average Weekly Wages and Salaries*. However, the design of the sample survey does not permit the publication of extensive geographic and industrial detail and the large-establishment employment indexes are the only source of current information of this type.

* More detailed information is given in DBS monthly publication *Estimates of Employees by Province and Industry* (Catalogue No. 72-008).

Subsection 4.—Estimates of Labour Income*

Labour income, as shown in Table 20, is the compensation paid to employees for services rendered either as wages and salaries or as supplementary labour income. Wages and salaries include directors' fees, bonuses, commissions, taxable allowances and benefits, some imputed earnings (e.g., those for persons in religious orders) and living allowances considered to be an additional benefit to the employee. Supplementary labour income, which consists of payments made by employers for the future benefit of employees, is composed of employers' contributions to employee welfare and pension funds, to the Workmen's Compensation Fund and to the Unemployment Insurance Fund.

* More detailed information is given in DBS publication *Estimates of Labour Income* (Catalogue No. 72-005).

20.—Wages and Salaries, by Industry, and Supplementary Labour Income, 1965-69, and by Month 1969

NOTE.—Based on the 1960 standard industrial classification. Figures are unadjusted for seasonal variation.
(Millions of dollars)

¹ Excludes military pay and allowances.

² Includes fishing and trapping.

Section 4.—Wage Rates, Hours of Labour and Other Working Conditions

Statistics on occupational wage rates by industry and locality, with standard weekly hours of labour, are compiled by the Canada Department of Labour and published in the annual report *Wage Rates, Salaries and Hours of Labour*. The statistics are based on an annual survey covering some 35,000 establishments in most industries and apply to the last normal pay period preceding Oct. 1. Average wage rates of time workers and average straight-time earnings of piece workers and other incentive workers for selected occupations are shown separately in the report but are combined in the calculation of industry index numbers shown in Table 21. Predominant ranges of rates for each occupation used are also given; overtime pay is excluded.

The index numbers of Table 21 measure changes in wage rates for non-office employees below the rank of foreman. They do not, however, provide a basis for comparing the level of wages in one industry with that in another. Information on concepts and methods of developing these statistics is given in the annual report.

21.—Index Numbers of Average Wage Rates for Certain Main Industrial Groups, 1961-69

(1961=100)

NOTE.—Figures for years prior to 1961 are not available on the 1961 base; indexes for 1956-65 on the 1949 base are given in the 1967 Year Book at p. 763 and indexes back to 1901 on the same base appear in the Department of Labour publication *Wage Rates, Salaries and Hours of Labour 1966*.

Table 23 gives summary data on working conditions of plant and office employees in manufacturing industries and all industries for the years 1967-69. The percentages in this table denote the proportions that employees—plant or office—of establishments reporting specific items bear to the total number of all such employees in all establishments replying to the survey; they are not necessarily the proportions of employees actually covered by the various items. Further details and additional information are given in the annual report *Working Conditions in Canadian Industry*, compiled and published by the Canada Department of Labour and based on a survey at May 1 each year of some 35,000 reporting units.

Wages of Farm Labour.—The information on farm wages is provided by volunteer farm correspondents located in all provinces except Newfoundland. The rates presented in Table 24 are average wages paid to all farm help regardless of age and skill. Because the rates reported may cover a wide range of skills, of types of work and of ages of hired workers, the value of the resulting data is considered to be an indicator of trends rather than a measure of absolute wage levels.

24.—Average Daily and Monthly Wages of Male Farm Help as at Jan. 15, May 15 and Aug. 15, 1968-70

Section 5.—Pension Plans*

Very few pension plans in Canada have been in existence for more than 25 years and most of the older plans were established by governments, banks and railways. The greatest growth in pension plans and coverage began during World War II and continued through

* Prepared by the Pension Plans Section, Labour Division, Dominion Bureau of Statistics.

the postwar years. In 1960 there were 9,000 pension plans in Canada covering some 1,800,000 persons and by 1969 the number of plans had increased to an estimated 18,400 covering some 2,441,000 persons.

Up to 1948, most plans were of the insured type, being underwritten by either an insurance company or the Government Annuities Branch of the Canada Department of Labour. The trust fund arrangement then began to grow in popularity and is now the dominant instrument for funding pension benefits measured in terms of membership and assets held. In 1969, contributions to trustee pension funds alone amounted to \$961,000,000, accounting for over 75 p.c. of all contributions to private pension plans excluding government plans having no invested assets. Funds of this magnitude represent a major medium for personal savings and the investment of these funds exerts a considerable influence on the capital market.

Table 25 shows the distribution of pension business for the years 1965-69, excluding the public service superannuation funds of the Federal Government and of six provincial governments which are nominal funds only, having no invested assets.

Most trustee pension plans use the facilities of corporate trustees (trust companies) who invest the contributions, accumulate the earnings and pay benefits to the plan members. Trustee pension plan funds are also managed by individual trustees or pension fund societies. The designated trustee, corporate or individual, must invest the contributions in accordance with the trust agreement which sets forth the rights and duties of the trustee. Many of the small funds invest in the "pooled funds" of trust companies which combine the assets of many pension funds, thus providing the diversification of investments usually available only to larger funds.

Federal Government Annuities.—Since 1908 the Federal Government has sold annuities and industrial pension plans under the Government Annuities Act (RSC 1952, c. 132). The purpose of the introduction of this legislation was to encourage people to save for old age but since the need for government service in this form has decreased in recent years, reduction of the program became justified and the employment of salesmen to solicit business was ended on Nov. 30, 1967. Annuities are still available under the Act to those who ask for them. They are now administered by the Unemployment Insurance Commission.

Section 6.—Unemployment Insurance*

During the depression of the 1930s the need for a nation-wide unemployment insurance program became recognized. In 1935 the Employment and Social Insurance Act was passed by the Federal Parliament but was subsequently declared invalid by the Privy Council. Later, by consent of the provinces, an amendment to the British North America Act was obtained empowering the Federal Parliament to legislate on unemployment insurance and in 1940 the Unemployment Insurance Act was passed, making provision for a compulsory contributory unemployment insurance program at the national level and also for the establishment of a national employment service to operate in conjunction with and ancillary to the unemployment insurance operations. The Act came into effect on July 1, 1941; amended on several occasions, it was replaced by a new Unemployment Insurance Act, effective Oct. 2, 1955.† On Apr. 1, 1965, the operation of the National Employment Service was transferred to the Department of Labour and on Jan. 1, 1966 to the Department of Manpower and Immigration (see pp. 843-844).

Legislation provides for a compulsory insurance program administered by the Federal Government, and requires employers to join with their insurable employees and the Government in building up a fund. This fund is held in trust by the Unemployment Insurance Commission for the payment of benefit to eligible unemployed persons. The Act is administered by a Commission of three persons appointed by the Governor in Council, of whom one is the Chief Commissioner; one Commissioner, other than the Chief Commissioner, is appointed after consultation with employer organizations and the other after consultation with employee organizations.

The Unemployment Insurance Act applies to all persons employed under a contract of service‡ except: the Canadian Armed Forces; the permanent public service of the Federal Government; provincial government employees except where insured with the concurrence of the government of the province; certified permanent employees of municipal or public authorities; persons engaged in hunting and trapping, private domestic service, private-duty nursing, and teaching; workers on other than an hourly, daily or piece rate earning more than \$7,800 a year effective June 30, 1968, unless they elect to continue as insured persons; employees in a charitable institution or in a hospital not carried on for purpose of gain except where the institution or hospital consents to insure certain groups or classes of persons with the concurrence of the Commission. All persons paid by the hour, day, or at a piece rate (including a mileage rate) are insured regardless of amount of earnings.

The amount of the employee contribution is determined by the employee's weekly earnings; an equal contribution is required from the employer. The Federal Government contributes one fifth of the aggregate employer-employee contribution and defrays administrative expenses. Contributions became payable on July 1, 1941. Benefit became payable on Jan. 27, 1942 and by Mar. 31, 1969 a total of \$6,262,000,000 had been paid.

The following statement shows the current weekly rates of contribution and benefit effective June 30, 1968. The weekly contribution is based on actual earnings in the week, irrespective of the number of days worked. The benefit rates are calculated on the average weekly contributions for the last 30 weeks in the 104 weeks preceding claim. In order to qualify for regular benefit, a claimant must have at least 30 weekly contributions in the last 104 weeks prior to claim, eight weekly contributions since the start of the last preceding

* Prepared by the Unemployment Insurance and Manpower Section, Labour Division, Dominion Bureau of Statistics; statistics of unemployment insurance are compiled and published by the DBS from material supplied by the Unemployment Insurance Commission.

† Copies of the 1955 Act incorporating subsequent amendments are available from Information Canada, Ottawa (Catalogue No. Y X92-222/80).

‡ Commencing Apr. 1, 1957, coverage was extended to persons engaged in fishing, notwithstanding the fact that such persons are not employees of any other person but are usually self-employed; commencing Apr. 1, 1967, coverage was extended to employees engaged in agriculture and horticulture.

regular benefit period or in the last year prior to claim, whichever is the shorter period, and 24 weekly contributions since the start of the last preceding benefit period, or in the year prior to the claim, whichever is the longer period.

WEEKLY RATES OF CONTRIBUTION AND BENEFIT UNDER THE UNEMPLOYMENT INSURANCE ACT, IN EFFECT FROM JUNE 30, 1968

NOTE.—Weekly rates in effect from Oct. 2, 1955 to June 30, 1968 are given in the 1962 Year Book, p. 738 and the 1967 edition, p. 769.

¹ A half stamp.

The Act contains a special provision whereby the regular contribution requirements are relaxed somewhat during a 5½-month period commencing with the first week of December each year. Under this provision, claimants unable to fulfil the contribution requirements for regular benefit may draw "seasonal benefit" if they have at least 15 contribution weeks during the fiscal year, or, failing this, if they terminated regular benefit since the previous mid-May.

Statistics on the Operation of the Act.—In order to assess the impact of changing economic conditions on the insurance program, provision is made for collection of current operational data, such as claims filed and processed and payments made. This information is published monthly in the *Statistical Report on the Operation of the Unemployment Insurance Act* (Catalogue No. 73-001). Current claims and payment data are useful for administrative purposes and are also a source of information to the public regarding financial and other aspects of the program.

Persons wishing to draw benefit must file either an initial or a renewal claim. Where it is necessary to compute entitlement to benefit, an initial claim is taken, otherwise a renewal. In the main, initial and renewal claims combined are an approximation of recorded separations from employment during a month. However, if a claimant exhausts his benefit and wishes to be reconsidered for further benefit, an initial claim is required. Such claims, accounting for approximately 15 p.c. of the monthly volume in 1969, are not new cases of unemployment. The count of claimants at the month-end indicates the extent to which claimants maintain contact with local offices of the Commission.

¹ Month-end average.

In addition to the monthly data published on the operation of the Unemployment Insurance Act, annual tabulations are compiled regarding persons employed in insurable employment and benefit periods established and terminated. These data are published in the annual report *Benefit Periods Established and Terminated under the Unemployment Insurance Act* (Catalogue No. 73-201). Data on persons insured under the Act are obtained from a 5-p.c. sample of insurance books and contribution cards renewed at June 1 each year (10-p.c. sample prior to 1969). Included are persons engaged in insurable employment as well as persons on claim at that date.

Benefit.—The duration of regular benefit is related to the contribution history—one week's benefit for every two weeks' contributions in the past 104 weeks with a maximum of 52 weeks. However, contributions more than one year old cannot be used if they have already been taken into account in computing previous rights. Disqualifications for benefit include: loss of work owing to a labour dispute in which the contributor is participating or directly interested; unwillingness to accept suitable employment; being an inmate of any prison or any institution supported out of public funds; refusal to attend a course of instruction or training if directed to do so; residence outside Canada unless otherwise prescribed. Disqualification of a claimant for a period not exceeding six weeks

may be imposed if an employee is discharged by reason of his own misconduct or leaves employment voluntarily without just cause or refuses suitable employment.*

Table 29 distributes regular benefit periods terminated by province and shows average weeks and average dollar benefit paid on these terminations. A claimant establishes a *regular benefit period* when he submits his claim in the prescribed manner and proves he has fulfilled the minimum contribution requirements. The duration of benefit and the weekly rate authorized, comprising total entitlement, are then calculated and the claimant's benefit may be drawn upon during successive intervals of unemployment. His benefit period terminates either when he has exhausted the amount authorized or when 52 weeks† have elapsed since he established, whichever comes first.

29.—Regular Benefit Periods Terminated, Duration and Average Amount of Benefit Paid, by Province, 1968 and 1969

NOTE.—In 1968, based on a 20-p.c. sample, except for Quebec and Ontario where a 10-p.c. sample was used; in 1969, the sampling ratio was 10 p.c. and 5 p.c., respectively.

Table 30 gives regular benefit periods terminated and average weeks paid, classified by age group of claimant.

* This list should not be considered exhaustive; more detail may be obtained from the Unemployment Insurance Act and Regulations.

† Under the Training Allowances Act, 1966, the benefit period of an insured person may be extended if he (or she) is in receipt of a training allowance. The benefit period is extended by the amount of time the person is undergoing training but in no event can the benefit period extend beyond 156 weeks.

Section 7.—Employment Injuries and Workmen's Compensation

Fatal Employment Injuries.—Data on fatal employment injuries, compiled by the Canada Department of Labour, are obtained from provincial Workmen's Compensation Boards, the Canadian Transport Commission, other government authorities and press reports. Of the 1,057 fatal injuries to industrial workers that occurred during 1969, 259 were the result of a person being struck by an object, 250 were caused by collisions, derailments or wrecks, and 208 by falls or slips. Inhalations, contact, absorptions, ingestions and industrial diseases accounted for 103 deaths and the act of getting caught in, on or between objects, vehicles, etc., accounted for another 100. There were 48 deaths caused by contact with electric current, 46 by conflagrations, temperature extremes and explosions, 17 by over-exertion and four by striking against or stepping on objects. The remaining 22 were the result of various miscellaneous accidents.

¹ Injuries requiring medical treatment but not causing disability for a sufficient period to qualify for compensation; the period varies in the several provinces.

² Includes, except where noted otherwise, payments to compensate loss of earnings, medical aid payments, cost of rehabilitation and hospitalization (not including capital expenditures) and pensions paid (not pensions awarded) for temporary and permanent disabilities; the Quebec compensation figure includes pensions awarded as well as pensions paid.

³ Excludes payments by employers who make direct compensation to their employees; such employees come under Schedule II of the Ontario and Quebec Workmen's Compensation Acts.

⁴ Estimated from a combined figure of 131,866 for temporary disability and permanent disability claims; these were the only figures available from the Ontario Workmen's Compensation Board.

Section 8.—Organized Labour

Subsection 1.—Union Membership

At Jan. 1, 1970, unions active in Canada reported a total membership of 2,173,000, comprising 33.6 p.c. of the non-agricultural paid workers in the country and 27.2 p.c. of the total civilian labour force. The increase in membership over 1969 was 4.7 p.c. and 36.7 p.c. over 1965.

Of the 1970 total, 1,632,000, or 75.1 p.c., were in organizations affiliated with the Canadian Labour Congress (CLC) and, of these, 1,111,000 were in unions also affiliated with the American Federation of Labor (AFL) and the Congress of Industrial Organizations (CIO) in the United States; another 207,000, or 9.5 p.c. were in affiliates of the Confederation of National Trade Unions (CNTU) and 15.3 p.c. were in various unaffiliated and independent national and international labour organizations.

Of the total union members in Canada, 62.5 p.c. belonged to international unions; another 34.6 p.c. were members of national and regional unions which charter locals in Canada only; and the remaining 2.9 p.c. belonged to independent local organizations and local unions chartered directly by the central labour congresses. In recent years there has

been an increase in the proportion which the membership of national and regional unions bears to the total and a corresponding decline in the proportion represented by internationals. This shift is attributable largely to the extension of collective bargaining rights in the public service sector and the concomitant inclusion of the membership of government employee organizations in the totals for national and regional unions. In 1965, there were 52 national and regional unions reporting 390,000 members; by 1970, the corresponding figures were 64 and 752,000.

Grand Totals.....	434	9,593	2,173,107

Of the 166 international and national unions reporting membership in January 1970, more than half, including 52 internationals and 30 national unions, had 5,000 or more members; the combined membership of these amounted to almost 2,000,000. The United Steelworkers of America (AFL-CIO/CLC) remained the largest union, reporting a Canadian membership of 150,000. Two national unions, both affiliated with the CLC, were next in size—the Canadian Union of Public Employees with 136,000 members (an increase of 11,500 over January 1969) and the Public Service Alliance of Canada with 120,000 members (an increase of 23,800 over the 1969 figure). A list of the unions reporting 30,000 or more members at the beginning of 1970 follows.

¹ Fewer than 30,000 members in 1969.² Not included prior to 1970.

Further details on the labour movement in Canada, including lists of individual unions, their membership, principal officers and the geographic distribution of their locals is carried in *Labour Organizations in Canada*, an annual publication of the Canada Department of Labour; it is available from Information Canada, Ottawa.

Subsection 2.—Wage Developments under Major Collective Agreements, 1969

The Canada Department of Labour obtains data on wage settlements under collective agreements on a quarterly basis. The agreements covered are limited to negotiating units of 500 employees or more in all industries, with the exception of construction. The base-rate for a negotiating unit is defined as a straight-time hourly wage rate for the lowest paid qualified workers, usually unskilled or semi-skilled workers, although some contracts govern only skilled workmen. Thus, the wage data are not necessarily representative of the average increases enjoyed by the workers in the negotiating unit as a whole. On the other hand, the data on numbers of agreements and workers refer to all occupational groups in the negotiating units.

Wage-rate data given in Tables 36 and 37 indicate that on Dec. 31, 1969, approximately 1,431,000 workers were covered by 661 major collective agreements in negotiating units with 500 or more workers in industries other than construction. The average base-rate rose 16.9 cents, or 7.1 p.c., during the 12-month period ended Dec. 31, 1969, compared with an increase of 14.9 cents or 6.6 p.c. during the preceding 12-month period. During 1969,

the consumer price index rose 4.6 p.c. and during 1968 it rose 4.1 p.c., so that, deflating the wage increases by the consumer price index increase, the average hourly base-rate increased in real terms by 2.4 p.c. during 1969 and by 2.4 p.c. during 1968.

36.—Employees Covered by All Collective Bargaining Agreements in Negotiating Units Covering 500 or more Employees in Industries other than Construction, in Effect December 1969.¹

Canada.....	265,340	193,540	458,880	972,100	1,430,980

¹ Refer to all agreements in force, irrespective of the year of settlement. As of Dec. 31, 1969, this universe included 661 agreements covering 1,430,980 employees.

² Covers agreements pertaining to workers located in more than one province.

Additional data are available from the Canada Department of Labour on wage settlements under agreements newly settled during quarterly periods, including number of agreements settled, number of employees affected and duration of contracts. The agreements covered are again limited to negotiating units of 500 employees or more in all industries except construction. Details are not given here but, for 1969 as a whole, 341 contracts were settled. These 341 settlements affected the wage-rates of about 780,000 workers. On the average, the 341 settlements provided an annual percentage increase in the straight-time hourly base-rate equal to 8.0 p.c. over the lives of the contracts; this percentage was the same as the comparable percentage for the year 1968.

Settlements during the year 1969 of one-year duration provided for increases averaging 8.0 p.c.; those of two-year duration for increases of 8.4 p.c. and 5.9 p.c. for the first and second years, respectively; and those of three-year duration of 10.8 p.c., 6.5 p.c. and 5.3 p.c. for the first, second and third years of the contract. These increases compare with those in 1968 as follows: one-year agreements, average increases of 7.3 p.c.; two-year agreements, average increases of 8.4 p.c. and 6.2 p.c.; and three-year agreements provided for average increases of 12.0 p.c., 6.7 p.c. and 5.1 p.c. for the first, second and third years of the contract.

37.—Annual Percentage and Cents-Per-Hour Increases in Base-Rates under Major Collective Agreements, by Month, 1969

NOTE.—Based on all major collective agreements covering 500 or more employees in force except those in the construction industry. Data refer to rates actually paid in the month specified; no adjustments have been made for retroactive wage increases.

Section 9.—Strikes and Lockouts

Statistical information on strikes and lockouts in Canada is compiled by the Economics and Research Branch of the Canada Department of Labour on the basis of reports from Canada Manpower Centres of the Department of Manpower and Immigration. Table 38 covers strikes and lockouts lasting 10 or more man-days. The developments leading to work stoppages are often too complex to make it practicable to distinguish statistically between strikes on the one hand and lockouts on the other. However, a work stoppage that is clearly a lockout is not often encountered.

The number of workers involved includes all workers reported on strike or locked out, whether or not they all belonged to the unions directly involved in the disputes leading to work stoppages. Workers indirectly affected, such as those laid off as a result of a work stoppage, are not included. Duration of strikes and lockouts in terms of man-days is calculated by multiplying the number of workers involved in each work stoppage by the number of working days the stoppage was in progress. The data on duration of work stoppages in man-days are provided to facilitate comparison of work stoppages in terms of a common denominator. They are not intended as a measure of the loss of productive time to the economy.

The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.

The important role played by transportation in the history and economic development of Canada has been told often and well. The history of Canadian transportation may be divided into three distinct stages—the early or development stage lasting up to about 1920, the monopolistic stage from 1920 to about 1950, and the competitive stage beginning in the early 1950s.

The early settlers of Canada depended almost exclusively on transport by water. Long before Confederation, public works such as canals and docks were built by local governments for the purposes of defence and internal economic development. However, as the movement of goods and people became heavier, waterways and canals were found to be inadequate as transportation routes and the railway came into use. The first was opened in 1836 but the real railway boom began in the 1850s, and their construction or promised construction formed part of the Confederation scheme of 1867. The promised construction of the Intercolonial Railway from Central Canada to the Maritimes was written into the British North America Act of 1867. Similarly, one of the conditions under which British Columbia joined Confederation in 1871 was that the Dominion Government undertake the construction of a railway connecting it with the rest of the country and in 1871 work started on the construction of a transcontinental line. The successful completion of the Canadian Pacific Railway in 1885 marks the end of this part of Canadian railway history. By 1905, Canada was committed to the building of two additional transcontinental rail lines—the Canadian Northern and the Grand Trunk Pacific. The expectation that these railways would operate profitably proved ill-founded as both (as well as the Grand Trunk Railway Company) collapsed as privately owned enterprises. A Royal Commission

in 1917 recommended that all three railways be consolidated with other government-owned railways; this proposal was accepted and the present Canadian National Railway System was founded. In the late eighteenth century Canada was one of the largest ship-owning nations in the world. However, by 1900, because of stiff foreign competition and the advent of iron and steel ships, Canadian ocean shipping tonnage had decreased by nearly half.

The second period of Canadian transportation history, 1920-50, was characterized by the rapid development of different, competing modes of transport. The motor vehicle emerged as one of the dominant features and not only revolutionized the transportation industry but became indispensable to modern living; registrations increased nearly tenfold from 280,000 in 1920 to 2,400,000 in 1949. Air service for the conveyance of passengers, mail and freight started in 1924 and later in the 1920s flying services were in operation between major urban centres. In 1937 the Canadian Government established Trans-Canada Air Lines (now Air Canada) as a national airline which, by the end of that decade, operated regular passenger services between the largest cities of the country. Equally important in the field of civil aviation was the amalgamation of a number of independent airlines to form Canadian Pacific Airlines. At the same time during this period, Canadian international sea-borne shipping in Canadian vessels had been declining due partly to the depression and partly to competition from other nations. High wages, depreciation and heavy interest charges also had a depressing effect on Canadian shipping.

In the late 1920s, the Canadian Government attempted to rehabilitate and unify the various individual and often competing railway companies. Despite all these efforts the financial position of the railways deteriorated during the depression years and did not improve until the outbreak of World War II. During the war, railways assumed the main burden of carrying food, ammunition and troops. Railway passenger traffic reached its peak in 1944 when 60,000,000 passengers were carried and then began to decline with the increasing use of the automobile and bus for short or medium distances and of air carriers for medium and long distances.

Since the end of the Second World War, the transportation field has become highly competitive. The growth of highway transport has been one of the most important developments. Its amazing growth may be traced directly to the great technical advances that have been made in the design and operating efficiency of motor vehicles and also to the development of secondary manufacturing industries, the decentralization of industry and the growth of metropolitan areas. Long-distance highway transport became important in the early 1950s and the construction of the Trans-Canada Highway in the following years gave a further direct impetus to the growth of the industry.

The St. Lawrence Seaway, opened 1959, has been of great economic benefit to Canada by permitting the low-cost movement of such bulk commodities as wheat, iron ore and coal. There has been some speculation that the Seaway might soon become obsolete due to technological progress currently taking place in transportation. There would seem to be little doubt that changes such as container ships, giant tankers, unit trains, etc., will certainly influence the future pattern of Seaway traffic.

Pipelines came rapidly into the picture following the discovery of vast petroleum and gas reserves in Western Canada in the late 1940s. By 1950, there were 1,400 miles of trunk pipeline in operation in Canada and just six years later the total was 5,807 miles. This mileage has grown into a vast network which is making possible the economical exploitation of Canada's tremendous resources of oil and gas. In the early 1950s resource developments and the building of defence projects in the Canadian North gave a great impetus to the growth of air freight but, more recently, the advance has been mainly in the area of inter-city operations.

The airlines' share of intercity passenger-mile traffic carried by public conveyances rose to 37 p.c. by 1968, a growth attributable to the demand for fast service and to the revolutionary technological developments that have occurred in this industry, mainly the development of the turbo prop and jet engines which permitted the use of larger and more efficient aircraft. During this period, Canada's two major airlines—Air Canada and Canadian Pacific (CP Air)—became world carriers, Air Canada ranking among the largest.

Automobiles now account for more than four fifths of all intercity passenger travel and this, together with the growth of travel by air, has had an adverse effect on intercity bus travel which has declined more than 50 p.c. since 1950. The railways, too, have lost traffic in the past 20 years, especially passenger traffic, for the same reason. Nevertheless, important advances have been made in the rail transport field, the most outstanding being, perhaps, their complete conversion to diesel power. Complex programs of plant and equipment modernization were undertaken and centralized traffic control devices, electrically controlled classification yards, piggybacks and unit trains were developed to fight the competition as well as to supply better service. It should be noted also that the railways are repeating in the Canadian North the essential services they performed in the early history of Canada when great isolated areas were being opened up to industry and development.

Thus, the Canadian transportation environment has changed fundamentally in the past 20 years and will keep changing as each mode of movement, in competition with the others, continues to take advantage of technological developments in its own area and continues to adapt to changing economic requirements.

PART I.—RAIL TRANSPORT*

The Canadian railway scene is dominated by two giant transcontinental systems, supplemented by a number of regional railways. The two largest railway companies control a wide variety of Canadian and international transport and communications services. The government-owned Canadian National Railway System is the country's largest public utility and operates the greatest length of trackage in Canada. It serves all ten provinces as well as the Great Slave Lake area of the Northwest Territories. In addition, it operates a highway transport service, a fleet of coastal steamships, a chain of large hotels and resorts, and a scheduled Canadian and international air service (see p. 939). The Canadian Pacific Railway Company is a joint-stock corporation operating a railway service in eight provinces. It is also a multi-transport organization, operating, in addition to its railways, a domestic truck network, a fleet of inland, coastal and ocean-going vessels, a chain of year-round and resort hotels and a domestic and foreign airline service (see p. 941). The Pacific Great Eastern Railway, owned by the British Columbia Government, operates over an 800-mile route from North Vancouver to Fort St. John in the Peace River area of northeastern British Columbia, and is currently being extended farther north toward Fort Nelson. The Northern Alberta Railway, jointly owned by CP and CN, serves the area north of Edmonton with a 900-mile system. Northern Ontario is served by the provincially owned Ontario Northland Railways with a 600-mile system stretching from North Bay to Moosonee, and by the privately owned Algoma Central Railway operating over 300 miles of line between Sault Ste Marie and Hearst.

Of the total railway revenue recorded in Canada in 1969, Canadian National contributed 52.2 p.c. and Canadian Pacific 36.7 p.c. The Quebec, North Shore and Labrador Railway,

* The statistical data in this Part were revised in the Transportation and Public Utilities Division, Dominion Bureau of Statistics; more detailed information is given in the annual reports of the Division.

built primarily to transport ore and concentrates from the iron mines of the Schefferville and Wabush areas of Labrador and Quebec to water transportation facilities on the St. Lawrence River, accounted for 2.4 p.c. of the revenues. Other railways contributing 1 p.c. or more to the total revenue figure were the Pacific Great Eastern 1.8 p.c., the Ontario Northland 1.1 p.c. and the Chesapeake and Ohio 1.0 p.c.

Even though the railways have in recent years faced strong competition from highway and air transport for the movement of people and much of the commodity trade, they are still indispensable for carrying bulk commodities and thus are necessary to the development of natural resources located in isolated areas of this great country. Only the pipelines have competed with the railways in this respect by providing an economical means of transporting the products of the oil and gas fields for long distances overland, and it is altogether probable that pipelines for transporting solids will, before long, constitute additional competition. (It is interesting to note that Canadian Pacific is in the forefront of research in this field.) The rapid growth of containerization in recent years has made the integration of the services of railway, highway, shipping and other modes of transport of growing importance. However, the two major railways of Canada, with their multi-transport interests, are in an excellent position to face this and other trends appearing in the transportation industry. Canadian railways have evolved over the past 100 years from a position of virtual monopoly in the movement of goods and people by rail, through a highly competitive stage to the present system of co-operation and co-ordination with other modes of transport. The latter approach permits each mode of transport to concentrate on the particular function it can perform most efficiently, thus establishing the most effective and economical system of transportation services possible.

Government Aid to Railways.—In order that the private railways of Canada might be constructed in advance of settlement as colonization roads or through sparsely settled districts where little traffic was available, it was necessary for federal and provincial governments and even for municipalities to extend some form of assistance. The form of aid was usually a bonus of a fixed amount for each mile of railway constructed and, in the early days, grants of land were also made other than for right-of-way. As the country developed, objections to the land-grant method became increasingly apparent and aid was given more frequently in the form of a cash subsidy for each mile of line, a loan or a subscription to the shares of the railway. Guarantees of debenture issues came later and, since the formation of the Canadian National Railways, all debenture issues of that System, except those for rolling-stock, have been guaranteed by the Federal Government. During the era of railway expansion before 1918, provincial governments guaranteed the bonds of some railway lines that afterwards were incorporated in the Canadian National Railway System. These bonds as they mature or are called are paid off by the Canadian National Railways, in large measure through funds raised by the issue of new bonds with Federal Government guarantee. Railway bonds guaranteed by the Government of Canada at Dec. 31, 1970 amounted to \$1,042,019,500.

As discussed on pp. 959-961, the National Transportation Act (SC 1967, c. 69), administered by the Canadian Transport Commission, expresses a national transportation policy for Canada aimed at the development of "an economic, efficient and adequate transportation system making the best use of all available modes of transportation at the lowest total cost". This law is intended to provide the railways with greater freedom to meet the competition with which they are faced and to develop as an integral part of today's complex transportation system.

Under the Act, the 1966 level of Federal Government rail subsidy of \$110,000,000 a year will decline by \$14,000,000 a year until it disappears at the end of 1974. The Crowsnest Pass rates on grain and flour from Western Canada and the rates under the Maritime Freight Rates Act remain in force. The so-called "bridge subsidy" paid under the Railway Act to the major railways for operation of lines through the light-traffic territory in the Lake Superior District ceased at the end of 1966 but the reduction in freight rates

made possible by the bridge subsidy remains in force. However, commencing on Mar. 23, 1968, the railways were permitted to make successive annual increases for a period of three years to the freight rates over the territory formerly covered by the bridge subsidy, to yield additional operating revenues in the first year of \$3,000,000, in the second year of \$2,000,000, and in the third year of \$2,000,000.

Track Mileage.—The first railway to be built in Canada—the Champlain and St. Lawrence Railroad between Laprairie and St. Johns (St. Jean), Que.—was officially opened for service on July 21, 1836. However, the first great period of railway construction did not take place until the 1850s when the Grand Trunk and the Great Western Railways were built as well as numerous smaller lines. The building of the Intercolonial and the Canadian Pacific Railways contributed to another period of rapid expansion in the 1870s and 1880s and, in the last period of extensive railway building (1900-17), the Grand Trunk Pacific, National Transcontinental and Canadian Northern Railways were constructed. Little change has occurred in the total track mileage in Canada since the 1920s. There has been some recent construction, including the CN-operated 230-mile Alberta Resources Railway west of Edmonton and the extension of British Columbia's Pacific Great Eastern Railway to Fort St. John, with construction continuing northward, but new construction has been largely offset by the abandonment of unprofitable lines.

¹ Defined as a single track extending the entire distance between terminals, upon which the length of the road is based. ² Includes 190 miles of track of the Cartier Railway which began operations in 1963 but was not included in the statistics until 1967. ³ Newfoundland included from 1950. ⁴ Excludes joint track amounting to 55 miles in 1965, 74 miles in 1966, 143 miles in 1967, 140 miles in 1968 and 141 miles in 1969.

Rolling-Stock.—Table 2 shows the numbers of the various types of freight and passenger equipment in operation in 1960, 1968 and 1969 revealing a generally downward trend prior to 1969; however, these figures do not reflect the offsetting trend toward larger, more efficient cars and locomotives or the steady improvement in speed of movement facilitated by modernized handling and terminal services. Each year hundreds of units, particularly freight cars, are converted and modified to make them suitable for specific types of traffic or are replaced by special-purpose equipment designed for distinctive hauling

jobs. The average capacity of all freight cars was 56.8 tons in 1969 compared with 51.4 tons in 1960. Also, although the number of diesel-electric locomotives in service has remained fairly static over this period, it should be noted that an extensive program of power upgrading has been followed by the railway companies. The combined tractive power (the force exerted by powered equipment measured at the rim of the driving wheels) of all locomotives in 1969 averaged 61,811 lb. as compared with 55,793 lb. in 1960.

¹ Includes those of non-rail industrial firms such as oil, chemical and railway car leasing companies which furnish freight cars to, or on behalf of, any railway line.

Traffic, Employment and Finance Statistics.—Statistics presented under this heading are for the Canadian National Railways, the Canadian Pacific Railway Company and 22 other common carrier lines whose gross revenues are \$500,000 or more annually. Excluded are the British Columbia Hydro and Power Authority Railway line and the Cartier Railway, and lines with annual revenues of less than \$500,000 annually, whose operations account for about 1 p.c. of the total.

Table 3 gives traffic and employment statistics for the above railways for the years 1965-69 and Table 4 gives similar data for the Canadian National and Canadian Pacific railways separately for 1968 and 1969.

¹ Total tonnage for 24 railways is sum of tonnages carried by individual railways; thus traffic handled by more than one railway (interline) is included more than once.

² Footnote ¹ applies also to number of revenue passengers.

The total tonnage of freight carried by all common carrier railways (including national loadings and receipts from United States connections) increased steadily for a number of years until 1969 when a 4.2-p.c. decline was experienced. In that year, mine products accounted for 41.4 p.c. of the total freight handled and the minerals carried in largest volume were iron ore, other ores and concentrates and bituminous coal.

Of the total of 207,595,448 tons of freight carried (excluding freight handled by more than one railway and in intermediate switching), manufactured products accounted for 35.2 p.c., agricultural products for 11.8 p.c., forest products for 11.0 p.c., animal products for 0.5 p.c. and less-than-carload lots for 0.1 p.c.

5.—Commodities Hauled as Freight by Railways, 1965-69

NOTE.—In this table duplications are eliminated, i.e., the same freight handled by two or more railways is counted only once. The statistics do not include the United States lines of the Canadian National Railways, but the link of the Canadian Pacific Railway line across Maine, U.S.A., is included, as are the Canadian sections of United States railways. Freight carried by the Cartier Railway is included from 1967 on.

Tables 6 to 12 give information on capital liability and capital investment in road and equipment, and on operating revenues, expenses and net income of all common carrier railways operating in Canada, except that of the Cartier Railway which is not available. A Uniform Classification of Accounts has been in operation for the Canadian National and the Canadian Pacific Railways since Jan. 1, 1956 and for other common carrier railways since Jan. 1, 1957. In transportation statistics, a distinction is made between expenditures and expenses. In the following data, the term 'expenses' is used as defined in the Uniform Classification of Accounts and refers to the expenses of furnishing rail transportation service and of operation incident thereto, including maintenance and depreciation of the plant used in such service.

6.—Capital Liability of Railways, 1960-69

(Exclusive of Canadian railway capital owned by Canadian railways)

¹ Restatement to reflect transfer of certain non-rail property of one railway to a subsidiary company.

Capital Structure and Financial Statistics of the Canadian National Railway System.—In view of the interest in Canada's publicly owned railway, the capital structure of the Canadian National Railway System is given separately in Table 8 and financial details in Table 9. The original financial structure of the CNR and the steps taken through the Capital Revision Acts of 1937 and 1952 to alleviate the burden of interest undertaken by the company on its formation in 1923 are described in the 1955 Year Book, pp. 840-847. Briefly, the Capital Revision Act of 1937 wrote off all loans that had been made to cover deficits and also unpaid interest on loans, and certain loans made for the purpose of additions and betterments were converted to equity capital, relieving the CNR from paying fixed charges on this amount. Under the 1952 Capital Revision Act, 50 p.c. of the company's interest-bearing debt was changed to preferred stock on which, after settling income taxes, a dividend of 4 p.c. is paid on earnings. Also, for a term of 10 years ended Jan. 1, 1962, the Railway was not obliged to pay interest on \$100,000,000 of its long-term debt. The Government is authorized to buy additional preferred stock annually in amounts related to the company's gross revenues. As a consequence, the proportion of total capitalization represented by equity capital in shareholders' account was raised from 34.5 p.c. at Dec.

31, 1951 to 67.2 p.c. at Jan. 1, 1952, and the proportion of borrowed capital was correspondingly reduced. By the end of 1967, the proportion represented by equity capital in shareholders' account was 50.7 p.c.

A 100-car CP Rail train carrying Alberta coal to Vancouver for shipment to Japan. To accommodate Canada's revitalized coal trade with a new unit train system, CP Rail is spending some \$35,000,000 on new coal-carrying cars, diesel locomotives and complementary robot power equipment, new and upgraded trackage and new servicing facilities.

The financial details presented in Table 9 are those of the Canadian National Railway System, including both Canadian and United States operations. Revenues and expenses include those of express and commercial communications and highway transport (rail) operations. In conformity with the requirements of the Uniform Classification of Accounts adopted Jan. 1, 1956, tax accruals and rents are charged to operating expenses.

¹ Includes appropriations for insurance fund.

² Contributed by or paid to the Government of Canada.

Revenues, Expenses and Net Income.—Total operating revenues and expenses of common carrier railways operating in Canada (except the Cartier) continued to rise, both reaching peak levels in 1969; increases over 1968 amounted to 3.6 p.c. and 4.1 p.c., respectively. However, because the increase in expenses was greater than that in revenues, net earnings declined slightly.

Of the total operating expenses in 1969 amounting to \$1,496,126,185, "transportation" expenses, including the operation of trains, yards, stations, wharves, etc., accounted for 38.9 p.c.; equipment maintenance for 21.8 p.c.; road maintenance for 18.4 p.c.; rents and taxes for 6.9 p.c.; expenses connected with traffic soliciting, such as advertising and information, ticket and freight offices, etc., for 2.8 p.c.; and general and miscellaneous expenses, including general overhead, accounting, dining and buffet services, grain elevators, etc., for the remaining 11.2 p.c. These proportions have remained fairly constant in recent years.

10.—Operating Revenues and Expenses of All Railways, 1960-69

NOTE.—These data cover all common carrier rail operations in Canada and therefore do not agree with those presented in Table 11 which represent only 24 of the larger lines.

Railway Accidents.—Accidents shown in Table 12 (for all common carrier railways operating in Canada) include all those in which railway trains were involved and accidents on railway property; all passengers injured are included but, for employees, only those who were kept from work for at least three days during the 10 days following the accident are recorded. The classification of accidents used in reporting other DBS statistics treats collisions between motor vehicles and trains as motor vehicle accidents. Therefore, care should be exercised when compiling total accidental deaths of all kinds or when comparing results of accidents of different kinds, such as train and motor vehicle.

PART II.—ROAD TRANSPORT*

Section 1.—Motor Vehicle and Traffic Regulations

The registration of motor vehicles and the regulation of motor vehicle traffic lies within the legislative jurisdiction of the provincial and territorial governments. However, the Federal Government has recently passed legislation establishing motor vehicle safety standards. This legislation is outlined below, followed by summaries of motor vehicle and traffic regulations common to all provinces and territories. The source of information on detailed regulations for each province and territory is given at pp. 907-908.

Federal Safety Regulations

The Motor Vehicle Safety Act (SC 1969-70, c. 30), which was passed by the House of Commons on Mar. 11, 1970 and received Royal Assent on Mar. 25, 1970, became effective Jan. 1, 1971. The general objective of the Act is to establish mandatory safety standards for new motor vehicles for the purpose of protecting persons against injuries or death and the impairment of health by exhaust emission and possibly noise. The legislation is directed to all new motor vehicles and components thereof manufactured in or imported into Canada. The safety of vehicles in use continues to be a provincial responsibility to be discharged under existing provincial legislation.

* Except as otherwise indicated, most of the material in this Part has been revised in the Transportation and Public Utilities Division, Dominion Bureau of Statistics.

The safety regulations currently include 29 standards relating to the design and performance of passenger cars, trucks, buses, motorcycles and trailers, five standards limiting motor vehicle exhaust emissions and ten standards applying to snowmobiles. These regulations will be subjected to continual review and additions or revisions will be incorporated to keep pace with engineering or technical advances. The regulations require all Canadian motor vehicle manufacturers or distributors to apply the national safety mark to every classified vehicle produced after Jan. 1, 1970 and this mark must be accompanied by a label certifying compliance with all applicable federal motor vehicle safety standards. Vehicles imported for commercial or individual use must comply with the Act and Regulations.

Provincial Motor Vehicle and Traffic Regulations*

Operators' Licences.—The operator of a motor vehicle must be over a specified age, usually 16 years (17 in Newfoundland and 18 for class A licence in Alberta), and must carry a licence, obtainable in most provinces only after prescribed qualification tests. Such licence is renewable annually in Saskatchewan, in the Yukon Territory and in the Northwest Territories; in Alberta it is renewable every two years; in Quebec, operator and chauffeur permits expire on the holder's birthday and the odd-numbered year following the issue of renewal thereof; in Prince Edward Island and New Brunswick it is renewable every two years and expires at the end of the licensee's birth month; in Newfoundland and Ontario a licence is issued on a three-year basis and expires on the licensee's birth date; and in Nova Scotia a licence is issued on a three-year basis and expires at the end of the licensee's birth month. Special licences are required for chauffeurs in all provinces except Newfoundland. In most provinces, a motorcycle operator is required to pass a special examination and have his driver's licence endorsed authorizing him to operate such vehicle or, if he has no driver's licence, he may be issued a licence to operate only this class of vehicle. In Alberta a person under 16 but not under 14 years of age may be issued a licence to operate a scooter, which is defined as a motor vehicle with a speed limit not exceeding 30 miles an hour.

Motor Vehicle Regulations.—All motor vehicles and trailers must be registered annually, with the payment of specified fees, and must carry two registration plates, one on the front and one on the rear of the vehicle (one only for the rear of trailers; in New Brunswick two licence plates are issued for all vehicles other than commercial tractors, trailers and motorcycles; in Prince Edward Island, Quebec, Manitoba, Alberta and British Columbia one plate is issued for motorcycles, to be mounted on the rear; in Saskatchewan, motorcycles and snowmobiles carry one plate on the rear and truck tractors carry one plate on the front).

In most provinces, in event of sale the registration plates stay with the vehicle but in Quebec, Manitoba, Saskatchewan and Alberta the plates are retained by the owner. In Nova Scotia, vehicles pass from owner to owner by due process of law and title must be secured before issue of plates and permit. A change of ownership of the vehicle must be recorded with the registration authority. However, exemption from registration is granted for a specified period (usually at least 90 days, except in Quebec where the maximum is three months for non-residents; in Ontario where it is six months for vehicles from other provinces and three months for vehicles registered outside Canada; in Manitoba where residents may use registration plates from other jurisdictions for 90 days, visitors are exempt from registration provided the vehicle is not used for business purposes, and an out-of-province student is exempt from registration provided he obtains a student sticker to be affixed to his windshield and provided the vehicle is properly registered in his home jurisdiction; in Saskatchewan where an out-of-province student may on application extend the period of exemption from registration requirements for the whole school year, provided the vehicle is properly registered in its home jurisdiction; in Alberta where non-residents may operate vehicles currently registered in their home province or state of the United States for a period not exceeding six months and in British Columbia where it is one month or six

* Revised according to information received from the respective provincial and territorial authorities concerned.

months for tourists and where an out-of-province student may extend the period of registration requirements for the whole school year, provided the vehicle is properly registered in its home jurisdiction). Regulations require a safe standard of efficiency in the mechanism of the vehicle and of its brakes and stipulate that equipment include non-glare headlights, a proper rear light, a muffler, a windshield wiper, a rear-vision mirror, and a warning device. In Ontario, under a 1968 amendment to the Highway Traffic Act, a certificate of roadworthiness is required for a vehicle sold on the second-hand market before a permit is issued for its operation.

Traffic Regulations.—In all provinces and territories, vehicles keep to the right-hand side of the road. Everywhere motorists are required to observe traffic signs, lights, etc., placed at strategic points on highways and roads. The speed limit in Prince Edward Island, unless otherwise posted, is 60 miles an hour in daytime and 55 at night; in Manitoba, the basic speed limit is 60 miles an hour in daytime and 50 at night unless otherwise posted—speed limits may be raised to 70 miles an hour or modified in semi-built-up areas; in Alberta it is 60 in daytime and 50 at night, with the exception of a few selected sections of four-lane highway where higher speeds may be posted; in Nova Scotia the limit is a “reasonable and prudent” speed, with a maximum of 60 miles an hour except where 65 miles an hour is authorized; in New Brunswick, maximum speeds vary from 50 to 60 miles an hour depending on type of highway; and in Ontario and Quebec maximum speeds vary from 50 to 70 miles an hour, depending on type of highway. In the other provinces the maximum speed permitted is normally 50 miles an hour; in Saskatchewan and British Columbia where higher speeds are in effect they are posted. In Yukon Territory the speed limit for all vehicles is 60 miles an hour, unless otherwise posted. In the Northwest Territories, the highway limit is 60 miles an hour for all vehicles, day or night, except as otherwise posted, and in municipalities it is 30 miles an hour except as posted. Slower speeds are required in cities, towns and villages (in Nova Scotia and British Columbia when passing schools and public playgrounds), at road intersections, railway crossings or at other places or times where the view of the highway for a safe distance ahead is in any way obscured. In most provinces, truck speed limits are at least five miles an hour below automobile speed limits, although in Manitoba, Saskatchewan and British Columbia they are the same as for passenger vehicles. In most provinces, accidents resulting in personal injury or property damage in excess of \$200 (\$100 in Newfoundland, Prince Edward Island, Nova Scotia, Quebec and the Yukon and Northwest Territories) must be reported to a police officer (in Nova Scotia to the Registrar of Motor Vehicles or to a police officer; in Quebec to a police officer or to the Motor Vehicle Bureau) and a driver involved must not leave the scene of an accident until he has rendered all possible aid and disclosed his name to the injured party.

Driver Licensing Controls.—All provinces and territories impose penalties for infractions of driving regulations, ranging from fines for minor infractions to suspension of the operator's driving permit, impounding of licence or imprisonment for more serious infractions. In most provinces penalties have been linked to a driver-improvement program, the aim of which is to correct faulty driving habits, not to take drivers off the road. The most common driver-improvement program includes the demerit-point-system.

Safety Responsibility Legislation.—Each province (other than British Columbia) has enacted safety responsibility legislation (sometimes referred to as financial responsibility legislation). In general, these laws provide for the automatic suspension of the driver's licence and motor vehicle registration of a person convicted of a serious offence (impaired driving, driving under suspension, dangerous driving, etc.). It also provides for the automatic suspension of a person's driving licence and registration of the owner whose uninsured vehicle is involved directly or indirectly in an accident resulting in damage in excess of \$200 or injury or death to any person (in Nova Scotia, Ontario, Manitoba, British Columbia, the Northwest Territories and Alberta the amount is \$100). In Saskatchewan, Alberta and Quebec, if a Judgment is rendered for damages against the driver or owner, the driver's

licence and registration remain suspended until the Judgment is satisfied and proof of financial responsibility for the future is filed. In Saskatchewan, the Yukon Territory and the Northwest Territories uninsured motor vehicles may be impounded following an accident of any consequence, i.e., an accident resulting in personal injury or death, or property damage in excess of \$100 (\$200 in Saskatchewan). In the Province of Quebec, furthermore, pursuant to the Code of Civil Procedure, the plaintiff may seize before Judgment the motor vehicle which has caused him damage whatever the amount of property damage whether covered for third-party insurance or not. In Ontario, Manitoba, Alberta and British Columbia the non-resident motorist is not required to carry or produce any form of proof of insurance. In Manitoba, proof of insurance must be supplied at the time of registration but if such insurance expires or is cancelled registration of the vehicle is not suspended unless the vehicle is involved in an accident.

In the Yukon Territory and the Northwest Territories, proof of insurance must be supplied before vehicle licence is issued, and when the insurance expires or is cancelled vehicle licence plates must be returned to the Registrar of Motor Vehicles. By order, the Yukon Commissioner and the Northwest Territories Commissioner may exempt certain areas from the insurance requirement.

Unsatisfied Judgment Fund.—Legislation has been enacted in all provinces except Saskatchewan and in the Yukon Territory, usually in the form of an amendment to the motor vehicle laws of the province or territory, providing for the establishment of a fund, frequently called an Unsatisfied Judgment Fund (in New Brunswick, the Unsatisfied Judgment Fee; in Ontario, the Motor Vehicle Accident Claims Act; in Alberta, the Motor Vehicle Accident Claims Fund; and in British Columbia, the Traffic Victims' Indemnity Fund), out of which are paid Judgments awarded for damages arising out of motor vehicle accidents in the province which cannot be collected in the ordinary process of law. In Newfoundland, Prince Edward Island, Nova Scotia, Quebec and British Columbia the fund is maintained by insurance companies. In all the other provinces, except Saskatchewan where insurance is compulsory, the funds are obtained by the annual collection of a fee from the registered owner of every motor vehicle or from every person to whom a driver's licence is issued. The fee usually does not exceed \$1 per annum; in New Brunswick the fee is \$3 a year; in Ontario a fee of \$25 is paid by the uninsured motorist (in the absence of the fee being paid the uninsured, if apprehended, is liable to a fine) and, in addition, the fund is subsidized by a \$1 annual charge from each licensed driver; in Alberta \$20 is collected from each uninsured owner of a motor vehicle at the time of registration or transfer; and Manitoba collects an additional \$25 from each uninsured owner at the time of registration.

A feature of this legislation, which is contained in some provincial statutes, is the provision for the payment of Judgments in hit-and-run accidents. When these occur, if neither the owner nor the driver can be identified, action may be taken against the Registrar of Motor Vehicles (the Minister of Finance in Newfoundland and the Administrator of the Motor Vehicle Accident Claims Fund in Alberta); any Judgment secured against the responsible authority is paid out of the Fund. All of these laws contain a provision limiting the amount that can be paid out of the Fund on one Judgment. In Newfoundland and Nova Scotia, the limits are \$10,000 for one person, \$20,000 for two or more persons injured in one accident and \$5,000 for property damage. In Nova Scotia and New Brunswick, the limit is \$35,000 in respect of any one accident. In Prince Edward Island and Quebec, the limit is \$35,000 for all damages in the same accident, subject to a deduction of \$200 from all damage to the property of others; damages resulting in bodily injury or death are, up to \$30,000, payable by priority over damages to property and the latter are, up to \$5,000, payable by priority over the former out of the amount of any insurance or other guarantee of indemnity. In British Columbia, the limit is based on the single amount of \$50,000 for any one accident with the provision that not more than \$5,000 may be paid on a property damage claim until injury claims up to \$45,000 have been satisfied; the \$50,000 limit exists for hit-and-run accidents but does not apply to

payments for property damage. In Alberta, the limit is \$35,000 for death or personal injury to one or more persons and \$5,000 for damage to property, subject to a limit of \$35,000 in any one accident; where in one accident claims result from bodily injury to or death of one or more persons and loss of or damage to property, claims arising out of bodily injury or death have priority over claims arising out of loss of or damage to property to the amount of \$30,000, and claims arising out of loss of or damage to property have priority over claims arising out of bodily injury or death to the amount of \$5,000. In Manitoba, the limit based on one accident is \$35,000, with Judgments arising out of bodily injury or death having priority to the extent of \$30,000 over claims resulting from loss of or damage to property; and Judgments arising out of loss of or damage to property having priority to the extent of \$5,000 over Judgments resulting from bodily injury or death; the maximum amount payable for a single Judgment resulting from loss of or damage to property is \$3,000, subject to a deduction of \$200.

In Ontario, the Motor Vehicle Accident Claims Act passed in 1962 replaced the Unsatisfied Judgment Fund which had been in effect since 1947. The new Act was streamlined to adjust promptly and efficiently all those claims incurred by the uninsured motorist. Claims could be adjusted much the same as by the insurance companies. The limits under an amendment to the Act of September 1969 are \$50,000, inclusive of \$5,000 for any property damage claim. Many small claims are handled by the Ontario Department of Transport, subject to a \$50 franchise clause in respect to property damage, but the procedure is such that claims can be settled under Sect. 5 of the Act without resort to litigation. Sect. 6 covers Judgment cases and Sects. 11 and 14 cover the hit-and-run cases in which a Judgment is necessary and property damage is not payable. A 1968 amendment to the Act gave the Minister of Transport power to act where the defendant is an infant.

Legislation.—The Vehicles Act, 1965.

Alberta

Administration and Legislation.—The Motor Vehicle Accident Claims Act (SA 1964, c. 56) and the Highway Traffic Act (SA 1967, c. 30) are administered by the Motor Vehicle Branch, Department of Highways, Edmonton. The Public Service Vehicles Act (RSA 1955, c. 265) and the Rules and Regulations are administered by virtue of authority vested in the Highway Traffic Board, Department of Highways, Edmonton.

British Columbia

Administration and Legislation.—Enforcement of the Motor Vehicle Act, the Commercial Transport Act and the Motor Carrier Act is vested in the Royal Canadian Mounted Police and the various municipal police forces. The Motor Carrier Act is administered by the Public Utilities Commission, the Motor Vehicle Act by the Superintendent of Motor Vehicles and the Commercial Transport Act by the Minister of Commercial Transport, Victoria, B.C.

Yukon Territory

Administration.—Commissioner of the Yukon Territory, Whitehorse, Y.T. Information regarding regulations may also be obtained from the Registrar of Motor Vehicles, Government of the Yukon Territory, Whitehorse, Y.T.

Legislation.—The Motor Vehicles Ordinance (Revised Ordinances 1958, c. 77, as amended).

Northwest Territories

Administration.—Commissioner of the Northwest Territories, Yellowknife, N.W.T.

Legislation.—The Vehicles Ordinance (1967, c. 9, second session).

Section 2.—Highways, Roads and Streets

Highways and Roads.—The populated sections of Canada are well supplied with highways and roads. Access to outlying settlements is provided to some extent by roads built by logging, pulp and paper, and mining companies, although these are not generally available for public travel. At the same time, great areas of Newfoundland, Quebec, Ontario, the Prairie Provinces, British Columbia and the Territories are very sparsely settled and are virtually without roads of any kind.

At the end of 1968, the reported mileage of highways and rural roads was 476,603 miles, a figure that includes all roads under provincial jurisdiction, federal roads and local roads under municipal jurisdiction other than the roads and streets in census metropolitan areas and urban centres of more than 1,000 population. Mileage for the latter is given separately under the heading of "Urban Streets".

¹ Includes taxis.

² Includes service cars, road tractors, farm tractors, etc.

³ Included with trucks.

Apparent Supply of Automobiles.—The apparent supply of automobiles in Canada in any year is computed by deducting the number exported from the sum of the production and imports. Statistics regarding retail sales and the financing of motor vehicle sales are given in Chapter XXI on Domestic Trade and Prices.

6.—Apparent Supply of New Automobiles, 1960-69

Provincial Government Revenue from Motor Vehicles.—The taxation of motive fuels, motor vehicles, garages, drivers, chauffeurs, etc., is an important source of provincial government revenue. In every province, licences or permits duly issued by the provincial authorities are required for motor vehicles of all kinds, trailers, operators or drivers, paid chauffeurs, dealers, garages and gasoline and service stations. In 1969, the average cost per motor vehicle for operating taxes and licences was about \$169 compared with \$162 in 1968.

The more important sources from which provincial revenue from motor vehicles is derived are shown in Table 7. Motive fuel tax rates are given in the Public Finance Chapter, Section 2, Subsection 2 on Provincial Taxes; Federal Government revenue from excise and sales taxes is given in the same Chapter, Section 3, Subsection 3 on Revenue from Taxation.

¹ Operators' licences are issued for different periods in different provinces; see p. 904 for provincial regulations.

² Includes other items not shown such as transfer of motor vehicles, garage and service station licences, and fines for infractions of motor vehicle laws.

³ Included with other motor vehicles.

⁴ Included with miscellaneous revenues and therefore in total.

⁵ Included with passenger automobiles.

⁶ Not complete.

Sales of Motive Fuels.—In order to estimate the total amount of motive fuel purchased in Canada for use in motor vehicles on public streets and highways, it has been necessary to eliminate from the total the amount of motive fuel used for other purposes. Thus, from the total or gross sales, including imports and exports, the following are subtracted to obtain net sales: tax exempt sales to the Federal Government and other consumers, exports, and sales on which refunds were paid. Net sales are thus defined as sales on which a tax or taxes have been paid in full and are considered to approximate the actual amount of motive fuel purchased in Canada for use on public streets and highways. As shown in Table 8, consumption of taxable gasoline, which is used almost entirely for automotive purposes, rose 4.7 p.c. in 1968 and net sales of diesel oil 8.1 p.c.

Passenger Buses.*—The operations of companies predominantly engaged in passenger bus service are summarized in Table 11. Data refer to the for-hire segment of the industry. Only firms engaged in intercity and rural operations and having an annual gross revenue of \$6,000 or over are covered. Operators predominantly involved in the provision of school bus service are not included nor are airport servicing and urban transit bus operators.

* Statistics are given in more detail in DBS annual report *Passenger Bus Statistics* (Catalogue No. 53-215).

11.—Summary Statistics of Intercity and Rural Passenger Bus Companies, 1964-68

NOTE.—Only carriers with annual gross revenue of \$6,000 or over are included.

Urban Transit Systems.—The collection of statistical information on urban transit systems has been extensively reorganized in recent years because of major changes made in the types of vehicles used for mass passenger movement in urban centres. The current series, which was started in 1956, includes operations of motor buses, trolley coaches, streetcars and subway cars carrying passengers in urban and suburban service.

¹ Excludes British Columbia Hydro and Power Authority.

There are two subway systems in operation in Canada; the Toronto subway was officially opened on Mar. 30, 1954 and the Montreal subway went into public use on Oct. 17, 1966.

Motor Vehicle Traffic Accidents.—There were 484,436 motor vehicle traffic accidents reported in 1968 compared with 452,759 in the previous year. Deaths from such accidents numbered 5,429 in 1967 and 5,318 in 1968 as against 3,118 in 1958. Statistics for 1968, reported by place of occurrence, are given by province in Table 13 but it should be noted that, although motorists are required by law to report accidents, complete statistics of these accidents are not available for all provinces.

PART III.—WATER TRANSPORT*

The Canada Shipping Act.—Legislation regarding shipping is consolidated in the Canada Shipping Act (RSC 1952, c. 29). Under the Act and its amendments, the Parliament of Canada accepts full responsibility for the regulation of Canadian shipping.

Section 1.—Shipping Facilities and Traffic

Subsection 1.—Shipping

All Canadian waterways including canals, lakes and rivers are open on equal terms, except in the case of the coasting trade, to the shipping of all countries of the world so that Canadian shipping must compete with foreign flag shipping.

Within the region from approximately Havre St. Pierre on the St. Lawrence River upstream to the head of the Great Lakes, the carriage of goods or passengers from one Canadian port to another Canadian port, commonly known as the coasting trade, is restricted to ships registered in Canada. Elsewhere in Canada, the coasting trade is open to all Commonwealth ships.

Canadian Registry.—Under Part I of the Canada Shipping Act, ships in excess of 15 tons net register and pleasure yachts in excess of 20 tons net are required to be registered; ships of lower tonnage may be registered voluntarily, otherwise they are required to be operated under a Vessel Licence if powered by a motor of 10 hp. or more. Sect. 6 of the Act restricts ownership to British subjects or bodies corporate incorporated under the law of a country of the Commonwealth or of the Republic of Ireland and having their principal place of business in those countries. Under the British Commonwealth Merchant Shipping Agreement, all Commonwealth ships are given the general designation 'British Ship', and a ship that should be but is not registered is not entitled to the privileges accorded to British ships. Ships in the planning stage or in course of construction may be recorded before registry by a Registrar of Shipping at one of the 75 Ports of Registry in Canada.

* Information and statistics dealing with this subject have been supplied as follows: aids to navigation, canals, harbours, administrative services and marine services by the Ministry of Transport and the National Harbours Board; the St. Lawrence Seaway by the St. Lawrence Seaway Authority; canal traffic and statistics of shipping by the Transportation and Public Utilities Division, Dominion Bureau of Statistics; and shipping subsidies by the Director of Subsidized Steamship Services, Water Transport Committee, Canadian Transport Commission.

The freight movement through a large port takes a number of different forms. These include cargoes for or from foreign countries and cargoes loaded and unloaded in coastwise shipping, i.e., domestic freight moving between Canadian points. There is, as well, the in-transit movement in vessels that pass through the harbour without loading or unloading and the movement from one point to another within the harbour, which in many ports amounts to a large volume.

Shipping statistics, which cover traffic in and out of both customs and non-customs ports, do not include freight in transit or freight moved from one point to another within the harbour. Table 4 shows the principal commodities loaded and unloaded in foreign and coastwise shipping at the 12 ports handling the largest cargo volumes in 1968. These ports handled 66.8 p.c. of all Canada's international shipping and 45.0 p.c. of the coastwise trade. The specific commodities shown are those transported in volume and often in bulk form.

4.—Principal Commodities in Water-Borne Cargo Loaded and Unloaded at Ports Handling the Largest Tonnages in 1968

NOTE.—Only commodities totalling over 50,000 tons are listed.

Large transport companies, facing increasing competition in satisfying present-day demand for fast and efficient movement of commodities and people, have become multi-transport and production operations. Canada Steamship Lines, for instance, is a mover by water and by land. It operates a large inland fleet of bulk carriers and fast package freighters built in its own shipyards, a trucking fleet with heavy-haulage trailers fanning out in every direction across the continent, intercity bus services moving thousands of people daily, and all the necessary terminal facilities.

Subsection 2.—Harbours

Water transportation cannot be studied with any degree of completeness without taking into consideration the co-ordination of land and water transportation at many of the ports. Facilities provided to enable interchange movements include the necessary docks and wharves, some for passenger traffic but most of them for freight, warehouses for handling of general cargo, and special equipment for bulk freight of all kinds. Facilities may include cold storage warehouses, harbour railway and switching connections, grain elevators, coal bunkers, oil storage tanks and, in the chief harbours, vessel repair docks.

Nine of the principal harbours of Canada are administered by the National Harbours Board and 11 other major harbours are administered by Harbour Commissions, which include municipal as well as Federal Government appointees. In addition, there are some 300 public harbours under the direct supervision of the Ministry of Transport, administered under rules and regulations approved by the Governor General in Council. Harbour masters are appointed by the Minister of Transport for these harbours, their remuneration being paid from fees levied on vessels, under the terms of the Canada Shipping Act.

Throughout the country there are several thousand wharves and breakwaters administered by the Ministry of Transport under the Government Harbours and Piers Act. These facilities are for the accommodation of cargo ships and commercial fishing craft and are under the general supervision of the Ministry of Transport District Marine Agents. Wharfingers, whose remuneration is determined as a percentage of wharfage fees collected, are appointed for the direct supervision of these public wharves and floats. The wharves are designed to accommodate the smallest fishing or pleasure craft or the largest ocean-going vessels, according to local requirements. At many ports, in addition to public harbour works operated by the administering authority, there are extensive dock and handling facilities owned by private companies including railway, lumber, pulp and paper, coal, steel, iron ore, petroleum, grain, fish and other industries moving large volumes of bulk materials.

In 1969, the harbours of Canada handled more than 245,609,000 tons of cargo in 223,000 vessel arrivals and departures in international seaborne and coastwise shipping.

National Harbours Board.—The National Harbours Board, a Crown corporation established in 1936, is charged with the administration and operation of the following properties: port facilities such as wharves and piers, transit sheds, grain elevators, cold storage warehouses, terminal railways, etc., at the harbours of St. John's (Nfld.), Halifax, Saint John (N.B.), Belledune (N.B.), Chicoutimi, Quebec, Trois-Rivières, Montreal, Churchill and Vancouver; grain elevators at Prescott and Port Colborne in Ontario; and the Jacques Cartier and Champlain Bridges at Montreal.

The installation of full container-handling facilities at several of the ports under NHB administration highlighted 1969 activities. During the year 38,000 full containers passed through the Port of Montreal following the opening of the first full container terminal there in late 1968. Interim container services were also available at Halifax, Saint John, Quebec and Vancouver while work continued on the provision of permanent facilities at the four ports to be in operation in 1970. The first outerport in the Americas, the Roberts Bank development at Vancouver, was completed and in operation in April 1970. This 50-acre facility for the bulk-handling of coal was created mainly from material dredged from the area and is connected with the British Columbia mainland by a three-mile causeway.

Facilities at the larger harbours are listed in Table 5, and summary traffic statistics for 1968 and 1969 in Table 6.

5.—Facilities of the Larger Harbours Administered by the National Harbours Board, as at Dec. 31, 1969

NOTE.—The facilities at these ports include those under the control of other agencies as well as those of the National Harbours Board.

¹ Includes a St. Lawrence Seaway crane of 275-ton capacity.

The capital values of the fixed assets administered by the Board at Dec. 31, 1969, amounted to \$404,558,351; this figure includes expenditure on all buildings, machinery and durable plant improvements less deductions for depreciation, and therefore represents a fair approximation of the present value of the properties. The total amount advanced by the Federal Government to the National Harbours Board for capital expenditure during 1969 was \$7,980,245, distributed as follows: Halifax, \$2,279,000; Saint John (N.B.), \$16,084; Quebec, \$1,740,000; Churchill, \$81,000; Vancouver (Roberts Bank), \$1,993,167; and Vancouver (Burrard Inlet Crossing), \$1,870,994.

Subsection 3.—Canals

The canals and canalized waters of Canada under the jurisdiction of the Ministry of Transport, together with those under the jurisdiction of the St. Lawrence Seaway Authority, comprise a series of waterways providing navigation for 1,875 miles inland from salt water.

Those included under the two classifications—Seaway canals and Ministry of Transport canals—are listed in Table 7 with their locations, lengths and lock complement. In addition to these, the federal Department of Public Works administers the St. Andrew's Lock (length, width and draught, respectively, 215, 45 and 17 feet) on the Red River at Selkirk, Man., and the lock at Poupore, Que. A few small locks are operated by provincial authorities.

During 1969, 97,357,234 tons of freight and 19,710 vessels passed through the canals as compared with 108,274,370 tons of freight and 20,378 vessels during 1968. In addition to freight and passenger vessels, thousands of pleasure craft are locked through the canals. Vessels locking at Sault Ste Marie during 1969 carried 192,891 passengers as compared with 138,011 in 1968.

7.—Lengths of Channels and Dimensions of Locks under the Control of the St. Lawrence Seaway Authority or the Ministry of Transport

Traffic using United States Locks at Sault Ste Marie.....	10,049,627	78,272,213	88,312,840	9,734,294	87,344,852	97,079,146
Totals.....	43,810,360	111,803,641	155,614,001	35,545,472	123,493,908	159,039,380

Cargo passing through the Canadian lock and the United States locks at Sault Ste Marie during 1969 totalled 98,506,987 tons, more than the 89,342,181 tons during the 1968 season but appreciably less than the record 128,489,170 tons reported for 1953. The United States locks, because of their larger facilities, accounted for all but 1,427,841 tons of the total. Iron ore, grains and coal normally contribute more than 90 p.c. of the combined tonnage moving through the Canadian and United States locks, most of it downbound. Because upbound transits are often in ballast, the 1969 upbound cargo accounted for only 10,394,050 tons of the total and consisted mainly of coal, gravel, liquid fuels and manufactured goods. Iron ore mines alone contributed 74,583,888 tons or 75.7 p.c. of the total 1969 traffic as against 65,681,543 tons in 1968, and wheat shipments were 7,960,799 tons as against 8,430,960 tons in the same comparison. A relatively small volume of wheat moves directly overseas—most of it is carried by the laker fleet to elevators along the St. Lawrence River to await trans-shipment to ocean-going vessels. Bituminous coal recorded a second consecutive decline in 1969 to 6,571,324 tons from 6,702,220 tons in 1968 but larger tanker cargoes of gasoline and fuel oil more than offset that loss.

Canadian Use of the Panama Canal.—The use of the Panama Canal as a transport facility for the movement of goods from one Canadian port to another is of relatively minor

importance. Of the total of 5,966,547 long tons of cargo leaving the West Coast of Canada in the year ended June 30, 1969 and passing through the Panama Canal, none were destined for eastern Canadian ports. Similarly, of the 1,313,554 long tons of cargo leaving eastern Canadian ports and passing through the Panama Canal, none were destined for western Canadian ports. The total tonnage passing through the Panama Canal and arriving in Canadian West Coast ports from any origin, Canada or elsewhere, amounted to 1,668,443 long tons in the year ended June 30, 1969; the total from any origin arriving at eastern Canadian ports after having passed through the Panama Canal was 666,764 long tons.

Subsection 4.—The St. Lawrence Seaway

Events leading up to the beginning of the St. Lawrence Seaway project and the progress made during the years of its construction are covered in the 1954 to 1959 Year Books. The 1956 edition (pp. 821-829) gives detailed information on Great Lakes-St. Lawrence waterway traffic immediately prior to the beginning of construction on the project and the 1960 Year Book (pp. 851-860) relates the story of the Seaway during the second year of its operation. The first decade of Seaway development and operations is discussed in the 1969 edition (pp. 841-845).

The St. Lawrence Seaway Authority, constituted as a Corporation by Act of Parliament in 1951 (RSC 1952, c. 242), undertook the construction (and subsequent maintenance and operation) of Canadian facilities between Montreal and Lake Erie to allow 27-foot navigation, concurrently with the construction of similar facilities in the International Rapids Section of the St. Lawrence River by the Saint Lawrence Seaway Development Corporation of the United States. The Seaway was opened to commercial traffic on Apr. 1, 1959 and officially opened on June 26, 1959. With the opening of the Seaway certain ancillary canals were transferred to the jurisdiction of the St. Lawrence Seaway Authority for operation and maintenance purposes. These include the Lachine, a section of the Cornwall Canal, a portion of the third Welland Canal and the Canadian locks at Sault Ste Marie. Tolls are not assessed against vessel movements on these waterways and traffic data for them are not included in this Subsection. Major construction undertaken in 1967 was on the channel to bypass the city of Welland, scheduled for completion by the navigation season of 1972.

Seaway Traffic.—Tables 13 and 14 give combined traffic statistics of the St. Lawrence and Welland Canals for the years 1968 and 1969. Duplicate transits are eliminated so that the figures show the actual total movement of goods through the St. Lawrence Seaway.

Totals	60,923,456	100.0	66,401,570	100.0	60,815,992	100.0

In 1969, 4,536 ships carrying about 25,314,000 tons of cargo moved upbound through the Seaway and 4,558 vessels carrying 35,501,000 tons moved downbound. Ocean-going ships carried 24.2 p.c. of the total cargoes and lakers 75.8 p.c. Of the total tonnage carried upbound in 1969, 18,723,000 tons were domestic cargo and 6,591,000 tons were foreign traffic; downbound, 27,347,000 tons were domestic freight and 8,154,000 tons were carried to and from foreign ports.

On the Montreal-Lake Ontario section, upbound traffic amounted to 22,445,000 tons in 1969 and downbound traffic to 18,569,000 tons, a decrease of 14.5 p.c. from 1968. Almost 51.5 p.c. of the former was accounted for by iron ore shipped from St. Lawrence ports to Hamilton and Lake Erie, and the latter consisted largely of overseas shipments of wheat. There were 72 fewer upbound transits and 112 fewer downbound transits in 1969 than in

1968, indicating a slight decrease in the number of vessels using this portion of the Seaway. Bulk cargo comprised 82.8 p.c. of the total traffic through the section in 1969, the principal commodities through the St. Lawrence canals being iron ore, wheat, corn, fuel oil, soybeans and scrap iron and steel. Traffic patterns show that 25.8 p.c. of the total movement was between Canadian ports, 38.0 p.c. moved between Canadian and United States ports and 35.9 p.c. consisted of foreign trade to and from Canada and the United States. The small remainder was traffic between ports in the United States.

There were 6,863 transits through the Welland Canal in 1969, with a cargo volume of 19,379,000 tons upbound and 34,153,000 tons downbound; bulk cargo accounted for 88.4 p.c. of the traffic. Although many vessels pass through both the St. Lawrence and the Welland Canals on "through" trips, there is a substantial amount of local traffic between Great Lakes ports which involves only the Welland Canal. These movements are largely of iron ore, grain and coal. The Welland Canal traffic was 12,518,000 cargo tons greater than that reported for the Montreal-Lake Ontario section.

Income of the St. Lawrence Seaway Authority for 1969 amounted to \$20,601,270, comprising toll revenue of \$18,138,610 assessed for transits through the Seaway locks between Montreal and Lake Ontario and sundry revenues (rentals, wharfage, bridge revenue, etc.) of \$2,462,660. Total expenses for 1969 amounted to \$17,544,146, of which operation and maintenance expenses amounted to \$11,929,907, regional headquarters, headquarters administration and engineering expenses amounted to \$4,798,851, and construction to \$815,388.

Section 2.—Marine Services of the Federal Government

The Marine Services of the Ministry of Transport comprises four Branches—Marine Works, Marine Regulations, Marine Operations, and Marine Hydraulics—each headed by a director responsible to the Administrator, Canadian Marine Transportation Administration.

The *Marine Works Branch* responsibilities include provision and maintenance of aids to navigation, maintenance and management of Canada's secondary canals, administration of public harbours and wharves, and general supervision of harbour commissions. It has three Divisions—Aids to Navigation, Canals, and Harbours and Property.

The *Marine Regulations Branch*, with two Divisions—Steamship Inspection and Nautical and Pilotage—is responsible for the administration of those parts of the Canada Shipping Act that relate to the operations of Canadian ships and ships within Canadian waters. It is charged with the registry and licensing of ships, the certification of ships' officers and the engagement and discharge of ships' crews. Other responsibilities include

pilotage, safety inspection of ships, handling of dangerous cargoes, prevention of oil pollution of Canadian waterways and air pollution by ships, and the investigation of marine accidents. It is also responsible for the co-ordination of Canada's participation in the Intergovernmental Maritime Consultative Organization, a United Nations body charged with the promotion of marine safety on an international basis.

The *Marine Operations Branch* is responsible for operating the departmental fleet, the Canadian Coast Guard, which consists of 146 ships of various types including both heavy and light icebreakers, an icebreaking cable repair ship and two weather-oceanographic ships, the CCGS *Vancouver* and CCGS *Quadra*, which alternate in manning Weather Station "Papa" in the Pacific Ocean.

A principal duty of the fleet is tending lighthouses, buoys and other aids to navigation in Canadian coastal and inland waters. Coast Guard ships, including icebreakers, take part each summer in the Ministry's Arctic re-supply operations, moving some 100,000 tons of cargo to more than 40 ports of call in the Far North. These ships work in conjunction with a number of chartered commercial vessels which carry most of the cargo. During the winter, the icebreakers operate in support of commercial shipping in the Gulf of St. Lawrence from Cabot Strait to the Quebec North Shore. They also operate in the St. Lawrence River to break ice jams and prevent flooding, particularly in the section between Trois-Rivières and Montreal.

The Coast Guard ships assist with projects of other Canadian Government departments, such as scientific programs carried out by research teams based aboard various ships ranging from the Great Lakes to the High Arctic in such fields as oceanography, hydrography and related sciences. Departments concerned with the development of the Canadian Arctic and with the welfare of its population also carry out their undertakings with the aid of Coast Guard ships.

A Canadian Coast Guard Officer Training College, officially opened in September 1966 at Sydney, N.S., provides a four-year course for students, who will graduate as junior engine-room or deck officers. Upon acquiring the necessary sea experience, they may take the examinations to earn the rank of engineer first-class or of master foreign-going.

The *Marine Hydraulics Branch* comprises three Divisions—Marine Hydraulics, the St. Lawrence Ship Channel, and Marine Traffic Control. Marine Hydraulics deals with the hydraulic and engineering aspects of providing navigable channels for marine transportation on the Great Lakes and the St. Lawrence River. Maintenance and improvements of the St. Lawrence River below Montreal and of the Saguenay River are under the jurisdiction of the St. Lawrence Ship Channel Division, which is located in Montreal.

In the interests of St. Lawrence River traffic safety, a Marine Traffic Control Service was established on Apr. 3, 1967, as a result of studies initiated by the Ministry in 1964. Using very high frequency (VHF) radio equipment, the Service keeps track of ship traffic in much the same way as the air traffic controllers watch over the busy sky lanes. The information needed to assist ships' masters in the safe conduct of their vessels comes from two main traffic control centres—one at Quebec and the other at Montreal—six shore stations and 18 reporting points along the river between Montreal and Les Escoumins, Que. All ships navigating the river must be equipped with the required VHF equipment to take advantage of the service.

Field Organization.—In the field, a regional management organization within the Marine Services is being developed. This system will provide the Ministry with more efficient means of matching resources to workloads in all areas. Included in the completed system will be the 11 district marine agencies that have existed for many years, and some 15 other Marine Services field offices that in the past have been reporting individually to Marine Services directors or to the Administrator, Canadian Marine Transportation Administration.

The first step was completed in May 1967 with the establishment of the Maritime Region. This covers the Maritime Provinces and their outlying islands including Sable

Island and the Magdalen Islands, and embraces all Marine Works, Marine Operations and Marine Regulations activities in the three provinces. In July 1968, the Western Region, including the Pacific Coast, western and northwestern Canadian waterways and the western Arctic, was established with the same responsibilities as the Maritime Region. Other Regions will be formed as reorganization progresses.

Aids to Navigation.—The Canadian system of aids to navigation is similar to that of other North American countries. Such aids maintained by the Ministry of Transport for Canadian and contiguous waters consist of buoys, lightships, lighthouses, day beacons, radio beacons and two electronic networks operating on the hyperbolic principle—Loran and Decca. The numbers of danger signals maintained during the years ended Mar. 31, 1968 and 1969 were:—

<i>Type of Aid</i>	<i>1967-68</i>	<i>1968-69</i>
	No.	No.
Lights.....	3,757	3,853
Lightships.....	1	1
Fog signals.....	390	384
Lighted buoys.....	2,199	2,300
Unlighted buoys and beacons.....	13,448	15,842

All aids incorporating light or sound devices are listed in the Ministry of Transport annual publication *List of Lights and Fog Signals*. Information on the radio beacons and on Loran and Decca is published in *Radio Aids to Marine Navigation*.

Navigable waters have been improved greatly by dredging in channels and harbours, by the removal of obstructions, and by the building of remedial works to maintain or control water levels. Incidental to these developments of navigable waters are works to guard shorelines and prevent erosion, and for the control of roads and bridges that cross navigable channels.

St. Lawrence Ship Channel.—This channel extends from about 40 miles below Quebec City to Montreal, a distance of 200 miles. About 130 miles of this distance is dredged channel. In the Montreal-Quebec reach, the channel has a limiting depth of 35 feet at extreme low water and a minimum width of 800 feet. Below Quebec the limiting depth of dredged channel, about 15 miles in length, is 30 feet at low tide, with a width of 1,000 feet. An average tidal range of 15 feet in this area provides sufficient depth for any vessel using the St. Lawrence route. Above Quebec, maintenance requirements as a result of silting in this dredged channel are relatively minor but below the city silting is more pronounced because of tidal action.

The Ship Channel is well defined by buoys and the centre marked by range lights, permitting uninterrupted day and night navigation throughout the open season. Year-round navigation from the sea to Montreal is made possible for reinforced ships by continuous icebreaking operations in the Ship Channel. The movements of ships, weather and ice conditions and obstructions to traffic throughout the St. Lawrence waterway are made available through the Marine Traffic Control Service (see p. 934).

Saguenay River.—The Saguenay River constitutes a naturally deep waterway up to Baie des Ha! Ha! on which lie the ports of Port Alfred and Bagotville. A dredged channel is maintained from St. Fulgence up to the port of Chicoutimi, providing a limiting depth of 20 feet at lowest normal tide and a minimum width of 250 feet.

Steamship Inspection.—The Steamship Inspection Service was established by authority of the Canada Shipping Act. Its functions include the formulation and subsequent enforcement of regulations concerned with the approval of design of hulls, machinery and equipment of ships; inspection during construction; periodic inspection and issuance of inspection certificates; the assignment of load lines; the conditions under which dangerous goods may be carried in ships; the protection against accident of workers employed in

loading and unloading ships; the protection from pollution of Canadian territorial waters by oil, chemicals, garbage, sewage or any other substances from ships; control of pollution of the atmosphere by smoke emitted by ships; control of the powering, equipment and load limits of small vessels; and the certification of marine engineers. The Board also prepares correspondence courses in marine engineering for use in Marine Engineering Schools now controlled by the Department of Labour.

The Chairman and the Board of Steamship Inspection are located at Ottawa and field offices are maintained in the principal ocean and inland ports. A total of 1,803 vessels of Canadian ownership or registry, including 449 passenger ships, 141 new ships built in Canada, nine ships built outside Canada for registry in Canada, and 14 converted or reconditioned ships were inspected during the year ended Mar. 31, 1969.

Pilotage.—Pilotage service functions under the provisions of Part VI and Part VIA of the Canada Shipping Act. Wherever a pilotage district has been created by the Governor in Council, qualified pilots are licensed by the pilotage authority of the district. There are in Canada 24 pilotage districts, in nine of which the Minister of Transport is the pilotage authority (see Table 16); in each of the other districts the authority is a local body appointed by the Governor in Council. There are also three districts that are administered jointly by Canada and the United States; and one area in which the Ministry of Transport provides qualified pilots.

PART IV.—CIVIL AIR TRANSPORT

Section 1.—Civil Aviation Administration and Policy

Administration.—Civil aviation in Canada is under the jurisdiction of the Federal Government and is administered under the authority of the Aeronautics Act and the National Transportation Act and amendments thereto. The Aeronautics Act is in three parts. Broadly speaking, Part I deals with the technical side of civil aviation comprising matters of registration of aircraft, licensing of airmen, the establishment and maintenance of airports and facilities for air navigation, air traffic control, accident investigation and the safe operation of aircraft. This Part of the Act is administered by the Director of Civil Aviation under the supervision of the Assistant Deputy Minister, Air Services, Ministry of Transport. Part II of the Act deals with the economic aspects of commercial air services and assigns to the Canadian Transport Commission certain regulatory functions of commercial air services (see p. 959). Part III deals with matters of government internal administration in connection with the Act.

International Air Agreements.—The position of Canada in the field of aviation as well as its geographical location makes imperative its co-operation with other nations of the world engaged in international civil aviation. Canada therefore took a major part in the original discussions that led to the establishment of the International Civil Aviation Organization (ICAO) which has headquarters at Montreal, Que. In 1970, Canada had air agreements with 25 other countries.

During 1969, two countries—the Netherlands and New Zealand—abrogated their air agreements with Canada. CP Air was required to cease services to New Zealand but both CP Air and KLM continue to operate between Canada and the Netherlands under special authorities issued by the respective governments.

Federal Civil Aviation Policy.—The intent of Federal Government concern in civil aviation is to provide an efficient and stable service for the Canadian public and the best possible economic framework for the orderly development of commercial aviation. In formulating its aviation policy in 1964, three principles were accepted by the Government as basic. The first related to the international field and stated that air services provided by Canadian airlines should serve the Canadian interest as a whole; that these services should not be competitive or conflicting but should represent a single integrated plan which could be achieved by amalgamation, by partnership or by a clear division of fields of operations. By a further policy statement in June 1965, the Minister of Transport defined more precisely the respective areas of operation of Air Canada and Canadian Pacific Air Lines Limited (CP Air) and additional international air services have since been introduced consistent with Government policy.

The second principle concerned the domestic mainline services and stated that, although competition was not to be rejected, development of competition should not compromise or seriously injure the economic viability of Air Canada's domestic operations which represent the essential framework of its network of domestic services, and in the event that competition continues, opportunity should be ensured for growth to both lines above this basic minimum. In accordance with this principle, the Government has authorized the Canadian Transport Commission to permit CP Air to operate additional transcontinental air services, and to serve Calgary, Edmonton and Ottawa in addition to Vancouver, Winnipeg, Toronto and Montreal which were already being served.

The third principle concerned the role of regional air carriers providing scheduled service and their relationship with the mainline carriers. Recommendations were prepared by the two major airlines and the larger regional carriers which resulted in a "Statement of Principles for Regional Air Carriers" tabled in the House of Commons on Oct. 20, 1966, by the Minister of Transport. These principles are summarized as follows:—

- (1) Regional carriers will provide regular route operations into the North and will operate local or regional routes to supplement the domestic mainline operations of Air Canada and CP Air; they will be limited to a regional role.
- (2) Greater scope will be allowed regional carriers in the development of routes and services by the following means: (a) where appropriate, limited competition on mainline route segments of Air Canada or CP Air may be permitted to regional carriers if this is consistent with their local route development; (b) in a few cases, secondary routes at present operated by Air Canada and CP Air may become eligible for transfer to regional carriers; and (c) a larger role will be allotted to regional carriers in connection with the development of domestic and international charter services, inclusive tours and new types of services.
- (3) Greater co-operation between the mainline carriers and the regional carriers will be developed in a variety of fields, ranging from technical and servicing arrangements to joint fare arrangements.
- (4) A limited policy of temporary subsidies for regional routes will be introduced, to be based upon a "use it or lose it" formula.
- (5) Firmer control will be exercised over the financial structure of regional carriers in connection with new licensing arrangements.
- (6) Regional carriers will be assisted with the acquisition of aircraft by development of a scheme for consultation between government and the carriers regarding plans for new aircraft, and by a special investigation designed to explore the possibility of developing a joint approach to this problem on the part of the carriers.

In a statement made on Aug. 15, 1969, the Minister of Transport defined more precisely the regions in which each of the five regional carriers would be permitted to supplement or authorized to replace mainline operations as circumstances warranted, and authorized the Canadian Transport Commission, in consultation with the mainline carriers and appropriate regional carriers, to give urgent consideration to the application of the regional policy. During 1969, the Air Transport Committee issued a number of decisions authorizing new services by regional air carriers in accordance with the Regional Air Policy, and the Committee is continuing an orderly application of this policy in consultation with the mainline and regional carriers, and in accordance with the procedures of the Canadian Transport Commission.

Thus, in the international field, the joint approach to the provision of world-wide service by the two major Canadian carriers is intended to strengthen their position in a very competitive field and provide a better over-all service to the travelling public. In the domestic field, a degree of competition remains to provide the public with the advantages that can result from a competitive atmosphere but avoids excesses of competition that could be ruinous to the operators and unsatisfactory to the public.

Section 2.—Current Air Services

The Canadian flag carriers operating on international air routes are Air Canada and CP Air, which together earn 77 p.c. of the total operating revenues of Canadian commercial air carriers; the five regional carriers (Eastern Provincial Airways, Nordair, Quebecair, Pacific Western Airlines and Transair) earn 12 p.c. The remaining 11 p.c. is earned by some 400 smaller airlines operating scheduled and non-scheduled services, many of them in Canada's hinterland which is relatively inaccessible by surface transport. On international routes, the Canadian flag carriers provide scheduled services to Europe, the Soviet Union, Japan and Hong Kong, Central and South America, the Commonwealth Caribbean, Australia and the United States (including Hawaii). Twenty-nine Commonwealth and foreign airlines have scheduled services between Canada and other countries (see p. 944).

The Canadian Transport Commission (Air Transport Committee) in its Directory of Canadian Commercial Air Services classifies commercial air carriers into two major groups—domestic and international—and divides these groups into nine classes:—

DOMESTIC AIR CARRIERS—

- (1) *Scheduled Air Carriers*—which offer public transportation of persons, mails and/or goods by aircraft, serving designated points in accordance with a service schedule and at a toll per unit;
- (2) *Regular Specific Point Air Carriers*—which offer public transportation of persons, mails and/or goods by aircraft serving designated points on a route pattern and with some degree of regularity, at a toll per unit;
- (3) *Irregular Specific Point Air Carriers*—which offer public transportation of persons, mails and/or goods by aircraft, from a designated base, serving a defined area or a specific point or points, at a toll per unit;
- (4) *Charter Air Carriers*—which offer public transportation of persons and/or goods by aircraft, from a designated base, at a toll per mile or per hour for the charter of the entire aircraft, or at such other tolls as may be permitted by the Air Transport Committee;
- (5) *Contract Air Carriers*—which do not offer public transportation but which transport persons and/or goods solely in accordance with one or more specific contracts;
- (6) *Flying Clubs*—which are air carriers incorporated as non-profit organizations for the purpose of furnishing flying training and recreational flying to club members;
- (7) *Specialty Air Carriers*—which operate for purposes not provided for by any other class such as aerial photography and survey, aerial distribution (crop dusting, pest control, seeding), aerial inspection, reconnaissance and advertising (forest, fire patrol, pipelines), aerial control (fire, water-bombing), aerial construction, and air ambulance and mercy services.

INTERNATIONAL AIR CARRIERS—

- (8) *International Scheduled Air Carriers*—are commercial carriers designated by the Government of any state to operate international scheduled air services between Canada and any other state, pursuant to an international agreement to which Canada is a party; and
- (9) *International Non-scheduled Air Carriers*—are carriers which are permitted by the Air Transport Committee to operate, between Canada and any other state, any commercial air service that is not a scheduled service.

Canada's International Flag Carriers

Air Canada.—The high standards of technical excellence coupled with a route network of 89,000 unduplicated route miles in domestic and international commercial air services extending to 62 destinations in Canada, the United States, the British Isles, Europe and the Caribbean, have made Air Canada a major asset to the Canadian nation. The years 1968 and 1969, the 31st and 32nd of Air Canada's operations, were characterized by modest increases in passenger traffic and lower load factors when compared with 1967 during which year, under the stimulus of Canada's Centennial celebrations (including Expo 67) and the Pan American games, traffic growth was exceptional. In general, the orderly growth of passenger traffic in 1968 and 1969 was adversely affected by labour and other social unrest in various areas of the world and by a decline in immigration to Canada.

Passengers carried on all services by Air Canada numbered 6,400,000 in 1968 and 6,600,000 in 1969, representing marginal increases of 1.0 p.c. in 1968 over 1967 and 3.1 p.c. in 1969 over 1968. Available seat-miles on scheduled services were up 4 p.c. to 10,100,000,000 in 1969 from 9,700,000,000 in 1968, while revenue passenger-miles on scheduled services reached 5,700,000,000, up 2 p.c. in 1969 from 5,600,000,000 in 1968. Passenger load factors on scheduled services continued to decline, from 66 p.c.

A million-dollar guarded shipment of paintings, antique porcelain, silver, arms, armour and furniture leaving London Airport by Air Canada DC-8 Jet Trader aircraft for Toronto, to be later sold by auction by the world-famous Sotheby's of London.

INDEX OF AIR CANADA AVERAGE YIELDS VS
CONSUMER PRICE INDEX, 1961-69

(1961=100)

in 1966 to 65 p.c. in 1967, to 58 p.c. in 1968 and to 57 p.c. in 1969. Operating revenues in 1969 rose a modest 4 p.c. to \$405,000,000, of which passenger revenue on scheduled services was \$333,000,000, an increase by only 1 p.c., over the operating revenues for 1968. There was a phenomenal 73-p.c. increase in revenues from charter operations to \$8,800,000 in 1969 over the previous year; freight revenues increased by 14 p.c. and mail revenues by 10 p.c. Net income after taxes was \$1,500,000 in 1969 compared with \$8,200,000 in 1968.

1.—Operating Statistics of Air Canada, 1960-69

NOTE.—Some of the figures in this table have been calculated from the monthly reports of Air Canada but most of them are from the audited annual reports of the corporation; there are slight variations in a few of the figures but the degree of error is less than 1 p.c.

Year	Traffic				Operating Revenue			Operating Expenses	Operating Profit	Net Income
	Revenue Passengers ¹		Revenue Com-mo-dity ²	Mail	Passenger	Freight ³ and Mail	Total ⁴			
	No.	Passenger-miles	Ton-miles	Ton-miles						
	'000	'000	'000	'000	\$'000	\$'000	\$'000	\$'000	\$'000	\$'000

¹ Scheduled and non-scheduled services.
includes express and excess baggage.

² Freight, express and excess baggage.

³ Freight includes express and excess baggage.

⁴ Passenger, freight, excess baggage and mail, plus all other operating revenue.

During 1969, Air Canada acquired six DC-8-63s and two DC-93s; at the year-end the corporation's fleet consisted of 112 aircraft comprising 32 DC-8s, 33 DC-9s, 12 Vanguards and 35 Viscounts. Jet travel continued on the up-trend; in 1969 jets accounted for 85 p.c. of total available seat-miles compared with 75 p.c. for the previous year.

Canadian Pacific Air Lines Limited (CP Air).—This private airline was established in 1942 by integrating a number of small bushline air carrier companies and has since developed into a major national flag carrier for Canada. In 1969, CP Air carried 1,300,000 revenue passengers 2,216,000,000 passenger-miles; of this total, 1,200,000 passengers were carried 1,985,000,000 passenger-miles on scheduled flights. Operating revenues for the year reached \$134,000,000, an advance of 25 p.c. over 1968; revenues from charter operations rose spectacularly from \$300,000 in 1968 to \$6,100,000 in 1969, while passenger revenues rose from \$88,000,000 to \$107,000,000.

CP Air's network radiates from the company's systems headquarters at Vancouver, serving Japan and Hong Kong over the Great Circle North Pacific Route; Holland over the Polar Route via Calgary and Edmonton; Honolulu, Fiji and Australia via the South Pacific Route; the Azores, Holland, Portugal, Spain, Italy and Greece via Toronto and Montreal on the North Atlantic Route; Mexico, Peru, Chile and Argentina via Montreal and Toronto on the South American Route; and regular West Coast flights between San Francisco, Hawaii and Vancouver. The airline's operations in the Far East are extremely important to Canada's relations with the developing nations in that area. Within Canada, CP Air transcontinental air services link Vancouver, Edmonton, Calgary, Winnipeg, Toronto, Ottawa and Montreal, and the company also operates interior services in British Columbia, Yukon Territory and northern Alberta.

CP Air became an all-jet airline in 1969, operating 20 aircraft—seven Boeing 737s, one Boeing 727, 11 DC-8s and one DC-3.

Regional Airlines

Regional airlines comprise five domestic companies (Eastern Provincial Airlines, Nordair, Pacific Western Airlines, Quebecair and Transair-Midwest), which provide north-south scheduled services linking Canada's northern regions with the metropolises of the south. In addition to their scheduled services, the five regional airlines operate charter air services within Canada as well as between Canada and other countries.

Eastern Provincial Airways (1963) Ltd.—This company is the regional carrier for the Atlantic Provinces. In 1969 it carried 162,000 revenue passengers 61,000,000 passenger-miles, and 7,495 tons of freight 3,000,000 ton-miles. Operating revenues were \$11,800,000, 30 p.c. higher than the 1968 revenues of \$9,100,000. Scheduled services are operated to Charlottetown and Summerside in Prince Edward Island; Moncton—Chatham and Charlo in New Brunswick; New Glasgow and Halifax in Nova Scotia; Deer Lake—Stephenville—Corner Brook, Gander, St. John's and St. Anthony in Newfoundland; Goose Bay, Wabush—Labrador City and Twin Falls Churchill Falls in Labrador; and Montreal, Sept Îles and the Magdalen Islands in Quebec. In addition to its scheduled services lifting passengers and freight in the four Atlantic Provinces and in eastern Quebec, the airline provides air services for mineral exploration, hunting and fishing, forestry and ambulance, seal and ice patrol, aerial photography and for other purposes, thus making a significant contribution to the development of areas in Canada relatively inaccessible by surface transport.

The company's mainline fleet comprises three Boeing 737s; three Handley Page Dart Heralds; one DC-4; two Convairs; and four DC-3s; its bushline fleet consists of five PBV Cansos; six DH Beavers; six DH Otters; two DH Twin Otters; one Beech Baron; and two Piper Super Cubs.

Nordair Ltée-Ltd.—Nordair with head office at Dorval, Que., was established in 1957 by the merger of Mont Laurier Aviation and Boreal Airways. Since its formation,

Nordair has enjoyed a steady expansion and operates scheduled services in Quebec, Ontario and in the Northwest Territories, as well as extensive domestic and international charter flights throughout Canada and from Eastern Canada to the southern United States and Caribbean islands.

Scheduled services are operated between Montreal and Hamilton, between Montreal and Great Whale and Fort Chimo in Quebec, and Frobisher Bay and Resolute Bay in the Northwest Territories. Nordair also maintains an extensive air service based at Frobisher Bay in the Northwest Territories supplying numerous Arctic settlements in the Baffin Island area, such as Clyde River-Cape Christian, Broughton Island, Pangnirtung, Cape Dyer, Cape Dorset, Coral Harbour, Hall Beach, Igloolik and Pelly Bay. Applications are now (mid-1970) before the Air Transport Committee to extend Nordair's services to Pittsburgh in Pennsylvania, Ottawa in Ontario and Alert in the Northwest Territories.

Nordair's charter flights accommodate inclusive tour travels and group travel. Nordair's northern charter operations are based at Fort Chimo and Frobisher Bay from which points a variety of aircraft, including DC-3s on skis, are available.

Nordair's fleet is composed of three Boeing 737-200Cs, five DC-3s, three C-46s, one DC-4, one Twin Otter and one Short Skyvan.

Pacific Western Airlines Ltd.—Pacific Western Airlines Ltd., with head office at Vancouver International Airport, operates over more than 11,000 route-miles; its services include scheduled mainline local regular unit toll and charter flights in British Columbia, Alberta, the Northwest Territories and Saskatchewan.

Regularly scheduled mainline services are operated north-bound from Edmonton to Prince George, Prince Rupert, Dawson Creek (B.C.); Peace River, Fort McMurray, Rainbow Lake, Fort Chipewyan (Alberta); Uranium City (Saskatchewan); Fort Resolution, Hay River, Fort Smith, Fort Simpson, Wrigley, Norman Wells, Inuvik, Yellowknife, Cambridge Bay and Resolute (Northwest Territories). The only no-reservations-required AirBus service in Canada operates daily between Calgary and Edmonton in Alberta. On the Pacific Coast, mainline services are operated from Vancouver to Comox, Powell River, Campbell River and Port Hardy. In the interior region of British Columbia, Pacific Western operates scheduled services from Vancouver to Kelowna, Penticton, Cranbrook, Kamloops and through to Calgary in Alberta. The company also operates international charter passenger services. Large aircraft charters are operated from major centres of Vancouver, Edmonton and Calgary. Pacific Western operates extensive freight services, both scheduled and chartered into the Northwest Territories. Three Lockheed Hercules provide charter freight services throughout the free world.

In 1969, 701,000 revenue passengers were carried, revenue passenger-miles totalled 395,000,000 and cargo ton-miles 20,000,000. Aircraft miles flown were 10,000,000. Comparable figures for 1968 were 427,000, 226,000,000, 10,000,000 and 6,000,000, respectively.

Aircraft operated by Pacific Western number 23, including two Boeing 707s, three Boeing 737s, four Convair 640 jet-props, three Lockheed Hercules (freight), six DC-6s, three DC-4s and two DC-3s.

Quebecair.—Quebecair, with head office at Montreal, offers scheduled services in Quebec and Labrador. The company dates from 1946 and was founded under the name "Le Syndicat d'Aviation de Rimouski". In 1947, the name was changed to Rimouski Airlines and the company inaugurated an air transport service between the shores of the Gulf of St. Lawrence, linking Matane, Mont Joli, Rimouski, Forestville, Baie Comeau and Sept Îles. Until 1953, service was limited to towns and small centres located between Rimouski and Gaspé on the south shore of the St. Lawrence River and between Forestville and Sept Îles on the north shore. In 1953, with amalgamation of Gulf Aviation, the name "Quebecair" was adopted. With the expansion of mining and industrial activities, it

extended its network to Quebec City and Schefferville in 1955, to Montreal in 1957, to Gagnon and Rivière du Loup in 1959, to Wabush in 1960, to Manicouagan and Saguenay in 1961 and to Murray Bay in 1962. During 1965, Quebecair acquired Northern Wings Limited and Northern Wings Helicopters Limited and merged their scheduled services. In 1967, Quebecair acquired A. Fecteau Transport Aérien Ltée, thus extending its operations to the Abitibi region and eastern bank of Hudson Bay. Quebecair was purchased at the end of July 1968 by Sogebry Ltée, a Montreal private holding company.

Quebecair is responsible for the operation of the scheduled services and the subsidiaries handle flights by light aircraft, charter and contract services. Scheduled services are operated over 6,000 miles serving some 43 localities in nine economic regions of Quebec and Labrador. Points linked are Montreal, Quebec City, Murray Bay (Charlevoix), Baie Comeau (Hauterive), Churchill Falls (Twin Falls), Gagnon, Wabush (Labrador City), Mingan, Mont Joli-Rimouski, Rivière au Tonnerre, Saguenay (Bagotville), Schefferville, Sept Îles, Senneterre, Mistassini, Temiscaming, Lac Doda, Lac Caché, Lac Mistassini, Rupert River, Fort George, Obedjiwan, Oskelaneo, Manouane, Val d'Or, Amos, Lebel-sur-Quévillon, Rupert House, Chibougamau, Matagami, Blanc Sablon, Saint Paul, Old Fort Bay, St. Augustin, La Tabatière, Tête à la Baleine, Harrington Harbour, Gethemani, Kégaska, Natashquan, Aguanish, Baie Johan Beetz, and Havre St. Pierre. Quebecair also operates group charters within Canada, to the United States and to the Caribbean, using 79 passenger jet aircraft.

Revenue passengers transported by Quebecair in 1969 numbered 211,000 for 79,000,000 passenger-miles compared with 189,000 for 56,000,000 passenger-miles in the previous year; 24,300 tons of goods were hauled 13,400,000 ton-miles in 1969 compared with 2,200 tons for 818,000 ton-miles in 1968. There was a substantial increase of 46 p.c. in operating revenues in 1969 to \$9,200,000 from \$6,300,000 in 1968.

At the end of 1969 the combined fleet of Quebecair and subsidiaries totalled 50 units: two BAC-1-11s, four F-27s, two DHC-6 Twin Otters, four DC-3s, one C-46, five DHC-3 Otters, 12 DHC-2 Beavers, two Cessna 185s, seven Cessna 180s, seven Bell 47-G-4As, three Hughes 300s and one Hughes 500.

Transair-Midwest.—This company was formed in November 1969 through the merger of Transair Limited and Midwest Airlines Ltd., both of Winnipeg. With headquarters at the Winnipeg International Airport, the company operates scheduled services in Manitoba, Saskatchewan, Ontario and the Northwest Territories and charter flights throughout Canada and from Canada to the United States. The company's scheduled services are operated in four areas: (1) the Prairies—from Winnipeg to Regina-Saskatoon-Prince Albert and return; from Winnipeg to Yorkton and return; (2) Manitoba—from Winnipeg to The Pas-Flin Flou-Lynn Lake-Thompson and return; from Winnipeg to Gillam-Churchill and return; from Winnipeg to Thompson-Churchill and return; from Winnipeg to Norway House and return; from Winnipeg to Brandon and return; from Winnipeg to Dauphin and return; (3) Eastern—from Winnipeg to Thunder Bay-Toronto and return; from Winnipeg to Kenora-Dryden-Thunder Bay-Sault Ste Marie-Toronto and return; from Winnipeg to Red Lake and return; and (4) Arctic—from Churchill to Eskimo Point-Rankin Inlet-Baker Lake and return; from Churchill to Coral Harbour-Repulse Bay-Hall Beach and return. Several other points in the Northwest Territories, including Yellowknife, are also served by flights from Churchill.

The diversity of Transair-Midwest's aircraft fleet, which is comprised of 58 aircraft, including 14 helicopters, supports the company's claim of being Canada's "most versatile" and "most complete" airline. The fleet ranges from small, single-engined aircraft equipped with wheels, skis or floats for access to remote hinterland and short-airstrip areas, to 34 multi-engine aircraft, including two Boeing 737 twin jets and four recently acquired Argosy 222 freighters capable of carrying 28,500 lb. Most of the fleet is stationed at Winnipeg but a DC-4 and a C-47 are usually positioned at the company's major base at Churchill, Man., in support of its arctic and DEW-line operations. Since 1961, under contract with the

United States Air Force, Transair has operated, from Winnipeg and Churchill, the vertical re-supply flights to the four main sites in the Canadian sector of the DEW-line in the extreme Arctic.

Major company developments in 1969 were: (1) the merger of Transair Limited and Midwest Airlines Ltd.; (2) the start of scheduled service from Winnipeg to Kenora-Dryden-Thunder Bay and return which replaces the former service between Winnipeg and Thunder Bay via Red Lake although Red Lake continues to be served by daily flights from Winnipeg; (3) the revision of the company's northern Manitoba route system to provide service between points on the two routes which were formerly entirely separate; and (4) a marked expansion in the number of charters operated, one for the Admiral Richard E. Byrd Polar Center to several points in the high Arctic including a flight over the North Pole, being particularly noteworthy.

During the first half of 1970, developments included: (1) receipt of two Boeing 737 twin jets; (2) authority from the Air Transport Committee of the Canadian Transport Commission to inaugurate on Apr. 26, 1970, a daily Boeing 737 service from Winnipeg to Thunder Bay-Toronto and return and a daily YS-11A service from Winnipeg to Kenora-Dryden-Thunder Bay-Sault Ste Marie-Toronto and return.

In 1969, Transair flew 4,090,550 miles and carried 180,000 passengers for 72,000,000 passenger-miles, compared with 134,000 revenue passengers for 58,000,000 passenger-miles in 1968; 9,500 tons of goods were hauled for 5,000,000 ton-miles as against 4,400 tons for 3,000,000 ton-miles in 1968. Operating revenues of \$8,500,000 in 1969 were 35 p.c. above the revenue of \$6,300,000 in 1968. Employees numbered 451, including 73 pilots.

Commonwealth and Foreign Scheduled Commercial Air Services

At the end of 1969, there were 29 Commonwealth and foreign air carriers holding valid Canadian operating certificates and licences issued for the following international scheduled commercial air services into Canada:—

Aeroflot, operating between Moscow (U.S.S.R.) and Montreal (Canada) in transit to New York.
Aeronaves de Mexico, S.A., operating between Montreal and Toronto (Canada) and Mexico City (Mexico).

Air France (Compagnie Nationale Air France), operating between Paris (France) and Montreal (Canada) and beyond to Chicago (U.S.A.) with traffic rights, and to other points beyond in transit to Los Angeles and New York.

Airwest Inc., operating between Calgary (Canada) and Spokane (U.S.A.).

Alaska Airlines Inc., operating between Ketchikan (U.S.A.) and Prince Rupert (Canada).

Alitalia (Italian International Airlines), operating between Rome and Milan (Italy) and Montreal (Canada) and beyond to Chicago (U.S.A.) with traffic rights, and to other points beyond in transit.

Allegheny Airlines Inc., operating between Erie (U.S.A.) and Toronto (Canada).

American Airlines Inc., operating between Toronto (Canada) and New York/Newark (U.S.A.) and between Chicago (U.S.A.) and Toronto (Canada), and between Los Angeles (U.S.A.) and Toronto (Canada).

British Overseas Airways Corp., operating between London and Manchester (England), Prestwick (Scotland) and Montreal and Toronto (Canada), beyond Montreal with traffic rights to Chicago and beyond in transit to Boston, New York and Detroit (U.S.A.) and between London (England), Prestwick (Scotland), Gander (Canada), Bermuda, Nassau, Montego Bay, Barbados and Trinidad.

BWIA (British West Indian Airways), operating between Port of Spain (Trinidad), Antigua, Barbados and Toronto (Canada).

Deutsche Lufthansa Aktiengesellschaft (Lufthansa German Airlines), operating between Germany and Montreal (Canada) and beyond in transit to Los Angeles (U.S.A.) and Mexico City.

Eastern Airlines, Inc., operating between the terminals Ottawa and Montreal (Canada), and New York (U.S.A.) and between the terminals Ottawa and Montreal (Canada), and Washington (U.S.A.) and between Tampa/Miami (U.S.A.) and Toronto (Canada) and between Buffalo (U.S.A.) and Toronto (Canada).

Iberia (Lineas Aereas de España), operating between Madrid (Spain), Montreal (Canada), Mexico City (Mexico) and Guatemala.

- Irish International Airlines (Aerlínte Aireann Teoranta)*, operating between Shannon (Ireland) and Montreal (Canada) and beyond in transit to Chicago (U.S.A.).
- Japan Air Lines Co. Ltd.*, operating between Tokyo (Japan) and Vancouver (Canada) and San Francisco (U.S.A.).
- KLM Royal Dutch Airlines*, operating between Amsterdam (Netherlands) and Montreal (Canada) and beyond in transit to Houston (U.S.A.) and Mexico City (Mexico) and for cargo to New York (U.S.A.).
- Mohawk Airlines, Inc.*, operating between Toronto (Canada) and Buffalo (U.S.A.) and Rochester (U.S.A.) and Toronto (Canada) and between Burlington (U.S.A.) and Montreal (Canada).
- North Central Airlines, Inc.*, operating between Thunder Bay (Canada) and Duluth/Superior (U.S.A.) and between Detroit (U.S.A.) and Toronto (Canada).
- Northeast Airlines, Inc.*, operating between Montreal (Canada) and Boston (U.S.A.) via Concord, Montpelier-Barre, Burlington and White River Junction (U.S.A.) and between Tampa/Miami (U.S.A.) and Montreal (Canada).
- Northwest Airlines, Inc.*, operating between Minneapolis (U.S.A.) and Winnipeg (Canada).
- Olympic Airways, S.A.*, operating between Athens (Greece), Montreal (Canada) and New York (U.S.A.).
- Qantas Empire Airways Ltd.*, operating between Sydney (Australia), San Francisco (U.S.A.) and Vancouver (Canada).
- Sabena Belgian World Airlines*, operating between Brussels (Belgium), and Montreal (Canada) and beyond in transit to New York (U.S.A.) and Mexico City (Mexico).
- Scandinavian Airlines System*, operating between Stockholm (Sweden), Bergen (Norway), Copenhagen (Denmark) and Montreal (Canada) and beyond in transit to New York and Chicago (U.S.A.).
- Seaboard World Airlines, Inc.*, operating between points in the United States, Gander (Canada) and points in Europe.
- Swiss Air Transport Company Ltd. (Swissair)*, operating between Zurich and Geneva (Switzerland) and Montreal (Canada) and beyond in transit to Chicago (U.S.A.).
- United Air Lines, Inc.*, operating between Vancouver (Canada) and Seattle (U.S.A.) and between Chicago (U.S.A.) and Toronto (Canada).
- Western Air Lines, Inc.*, operating between Calgary (Canada) and Great Falls/Denver (U.S.A.) and between Los Angeles/San Francisco, Portland (U.S.A.) and Vancouver (Canada).
- Wien Consolidated Airlines Inc.*, operating between Whitehorse, Y.T. (Canada) and Fairbanks and Juneau (Alaska, U.S.A.).

Personnel Licences

At Mar. 31, 1970, the total number of personnel licences in force in Canada was 37,492, compared with 35,378 on the same date of 1969. The 1970 licences were constituted as follows, with comparable 1969 figures in brackets: glider pilots, 1,356 (1,190); private pilots, 23,748 (22,824); commercial pilots, 4,677 (4,525); senior commercial pilots, 698 (544); airline transport pilots, 2,676 (2,206); flight navigators, 216 (210); air traffic controllers, 948 (937); flight engineers, 95 (114); aircraft maintenance engineers, 3,074 (2,825); and gyrocopter pilots, 4 (3).

Air Traffic Control

The primary functions of Air Traffic Control in the Ministry of Transport are to prevent collisions between aircraft operating within controlled airspace and between aircraft and obstructions on the manoeuvring area of controlled airports, and to expedite and maintain a safe, orderly flow of air traffic. These functions are carried out by Air Traffic Controllers situated in Airport Control Towers, Terminal Control Units and Area Control Centres. The services provided by these units are described below.

Airport Control Service is provided to aircraft operating on the manoeuvring area or in the close vicinity (5-10 nautical-mile radius) of civil airports where the volume and complexity of air traffic indicate its need in the interest of flight safety. Service is also provided to other traffic, such as vehicles and maintenance equipment, on the manoeuvring area of an airport. Radio is the prime means of communication in the provision of the service, although light signals may be used where radio is not available. Airport Control

Towers are in operation at: Gander International, St. John's, and Wabush (Labrador) in Newfoundland; Halifax International and Sydney in Nova Scotia; Fredericton, Moncton and Saint John in New Brunswick; Baie Comeau, Cartierville, Montreal International, Quebec, St. Hubert, St. Jean and Sept Îles in Quebec; Buttonville, Hamilton, London, North Bay, Oshawa, Ottawa International, Sault Ste Marie, Thunder Bay, Toronto International, Toronto Island, Waterloo-Wellington and Windsor in Ontario; Brandon, St. Andrews and Winnipeg International in Manitoba; Regina and Saskatoon in Saskatchewan; Calgary International, Edmonton International, Edmonton Industrial, Lethbridge and Springbank in Alberta; Abbotsford, Fort St. John, Kamloops, Penticton, Pitt Meadows, Port Hardy, Prince George, Vancouver International and Victoria International in British Columbia; and Whitehorse in the Yukon Territory.

Canada's air traffic control facilities, although ranking in quality among the world's best, are in course of being automated and refined in response to advances in electronics and extended to overcome gaps in present coverage including the far northern areas. Installation of two systems, expected to be the nucleus of the total computerized nation-wide system, will be completed in 1971 on a test basis. It will provide for the 'remoting' of radars anywhere they are needed, eliminate the controller's manual operations and give instantly all information that could be needed on an aircraft in flight.

The Montreal area control centre showing flight strips recording flight information posted on the master boards. These must be updated constantly by the controllers, a time-consuming task subject to error.

Prototype of the new fully automated system, which will leave the controller free to manage aircraft in his control zone. When an aircraft moves from one radar screen to another, the operator can alert the new controller by making the aircraft blip on and off.

Terminal Control Service is provided to aircraft which are 'climbing out' after departure from or 'letting down' for a landing at an airport. It is a service provided to such flights operating in accordance with the Instrument Flight Rules in order to separate them from one another and from en route aircraft operating through the Terminal Area which normally is an airspace within 30-50 nautical miles of an airport and which, in some cases, may encompass more than one airport. Radar is normally used, in conjunction with direct controller-pilot radio communication, in the provision of this service. Procedural means are used at some remote locations where radar is not yet available. The service is provided from all Area Control Centres but separate Terminal Control Units are installed at high traffic density airports where no Area Control Centre is located. Such separate units have been established at Halifax in Nova Scotia; Quebec City in Quebec; North Bay, Ottawa and Thunder Bay in Ontario; Regina and Saskatoon in Saskatchewan; and Calgary in Alberta.

Area Control Service is essentially an aircraft separation and flight-following service provided to aircraft operating en route between airports. All flights that elect to file flight plans are given flight-following service, and separation is provided to all aircraft operating in accordance with the rules for instrument flight or controlled visual flight within designated controlled airspace, i.e., all airways below 23,000 feet above sea level (ASL) and all airspace in Canada south of 70° North latitude above 23,000 feet ASL. In addition, the service is provided north of 70°N to all aircraft operating above 29,000 feet ASL, and to aircraft operating above 5,000 feet over almost all of the western half of the North Atlantic Ocean. Separation is provided using both radar and procedural means, with direct and indirect communication between controller and pilot. An extensive land-line communication system links an Area Control Centre with all affiliated Airport Control Towers, Terminal Control Units and communication stations and with adjacent Area Control Centres in Canada and adjoining States, as well as with other agencies providing supporting and auxiliary services or having a need to deal directly with the centre, i.e., air carrier operation agencies, military operation agencies, etc. Additional services provided by Area Control Centres are:

Aircraft Movement Information Service which assists the Department of National Defence in establishing the identification of all aircraft operating in specified areas.

Customs Notification Service which facilitates the notification of the appropriate customs agency by pilots planning to cross the Canada-United States border at certain designated customs airports. This service is provided when requested by a pilot in his flight plan.

Alerting Service which ensures that the appropriate search and rescue organization is notified of an aircraft which may be in need of its aid.

Flight Information Service which provides pilots with advice and information useful for the safe and efficient conduct of flight, including weather reports and forecasts, field condition reports, data concerning aids to navigation, traffic information and other information of use to the pilot in planning and conducting a flight.

Area Control Centres are located at Gander in Newfoundland; Moncton in New Brunswick; Montreal in Quebec; Toronto in Ontario; Winnipeg in Manitoba; Edmonton in Alberta; and Vancouver in British Columbia.

Airspace Reservation Service provides reserved airspace for specified operations within controlled airspace and information to other pilots concerning these reservations and military activity areas in controlled and uncontrolled airspace. The Airspace Reservation Coordination Office, located in Ottawa, is responsible for provision of the service in all the airspace of Canada and in the Gander Oceanic Control Area.

Ground Facilities

Canadian aerodromes are listed in Table 2, classified by administrative agency as licensed or unlicensed land facilities or seaplane bases, or military aerodromes. Licensed aerodromes are those that are inspected by Ministry of Transport inspectors at regular

intervals and meet specific standards. In addition to aerodromes, a network of radio aids to navigation is maintained to facilitate en route navigation and safe landings under instrument conditions.

Airport Activity.—In 1969, aircraft movements at the 159 airports reporting such movements totalled 5,850,000, of which 1,326,000 were reported by airports without control towers and 4,488,000 by the 51 airports with towers operated by the Ministry of Transport (see p. 945). Of the latter, the 46 airports with Ministry of Transport towers registered 4,325,000 aircraft movements and the five Department of National Defence airports reported 163,000 movements.

The following chart shows the growth of aircraft movements at airports with Ministry of Transport towers during the decade ended in 1969.

For the second consecutive year, Toronto International Airport led in itinerant activity. Montreal International Airport retained second place after leading from 1964 to 1967; the exceptionally high movements at Montreal in 1967 were attributable to the influx of visitors to Expo 67. Vancouver and Winnipeg International Airports occupied third and fourth positions, respectively, in 1969, unchanged since 1965, and Ottawa was in fifth place, having replaced Cartierville which held that place from 1965 to 1968.

**AIRCRAFT MOVEMENTS BY CLASS OF OPERATION
AT AIRPORTS WITH MINISTRY OF TRANSPORT
AIR TRAFFIC CONTROL TOWERS, 1960-69**

Rankings of the five leading airports in itinerant movements for 1965, 1967 and 1969 were:—

International Airport	1965		1967		1969	
	Rank	Itinerants	Rank	Itinerants	Rank	Itinerants
		No.		No.		No.
Toronto.....	2	99,958	2	141,477	1	165,426
Montreal.....	1	107,255	1	151,202	2	148,027
Vancouver.....	3	84,879	3	124,748	3	142,120
Winnipeg.....	4	74,787	4	106,776	4	114,161
Ottawa.....	7	62,845	6	82,705	5	93,194

At the Ministry of Transport airports with air traffic control towers, aircraft weighing less than 4,000 lb. accounted for 46 p.c. of the itinerant movements in 1969 and those weighing over 39,000 lb. for 30 p.c. Aircraft in the heaviest weight group (over 314,000 lb.) recorded a phenomenal growth from 41 itinerant movements in 1965 to 4,027 in 1967 and to 29,666 in 1969.

In 1969, international movements rose 8.4 p.c. over 1968 to reach 199,089 and 41.5 p.c. of them were reported by Toronto and Montreal International Airports. Toronto handled 66,892, of which 59,343 were "transborder" (to and from the United States) and 7,549 were "other international" (to and from points outside Canada and the United States). Montreal International reported 49,645 international movements, of which 35,241 were transborder and 14,404 were other international.

During 1969, airports without towers, of which there were 108, handled 1,362,000 movements, 6.8 p.c. fewer than the 1,462,000 movements reported by the 102 airports in the 1968 survey. Itinerant movements were 397,000, up 12.1 p.c. over the 354,000 in 1968, and local movements, which were mainly training flights, numbered 965,000, 12.9 p.c. fewer than the 1,108,000 movements in the previous year.

Section 3.—Civil Aviation Operation Statistics

In Table 3 the statistics in respect of commercial air services in Canada for the period 1965-69 relate to foreign airlines (including those of the United States and to Canadian airlines that earned annual gross flying revenues of over \$100,000 in 1965-68 and over \$150,000 in 1969. The figures for Canadian airlines cover both domestic and international operations; the data for foreign airlines cover miles and hours flown only over Canadian territory and exclude passengers and goods in transit through Canada.

3. —Summary Statistics of Commercial Air Services, 1965-69

NOTE.—Most of the figures in this table are from the audited annual reports of commercial air carriers; where preliminary figures have been used there are occasionally slight variations from the audited figures but the degree of error is less than 1 p.c.

PART V.—OIL AND GAS PIPELINES*

Oil Pipelines.—Since the late 1940s large capital expenditures have been made each year for oil pipeline construction. In 1969 they were estimated at \$52,600,000 and were forecast at \$25,500,000 for 1970, raising the estimated cumulative total for the period 1950-70 to \$1,001,900,000.

The prime components of the network of Canadian oil pipelines are the trunk lines of the Interprovincial Pipe Line Company and the Trans Mountain Oil Pipe Line Company. The bulk of domestic crude oil is carried in these lines. Refineries that do not rely on these systems are located in the oil producing regions such as Calgary and Edmonton. The Interprovincial system carries crude oil eastward from Edmonton, receiving and discharging oil at various locations along its length. The Trans Mountain system operates similarly westward from Edmonton. Supplying these two trunk lines are pipe-

* Prepared in the Mineral Resources Branch, Department of Energy, Mines and Resources, Ottawa.

line systems funnelling oil from hundreds of fields into storage tanks at the pipeline terminals. Some of these feeder lines are impressive in themselves, not only in size of pipe and in length of route but in the volumes of oil that they transport. Most of the feeder lines are in Alberta, which is to be expected because of the pre-eminent position of that province in oil production.

The main pipeline terminal at Edmonton has 10 crude oil feeder lines, including the Interprovincial extension to Redwater, as follows:—

<i>Pipeline</i>	<i>Total System Length</i>	<i>Capacity</i>	<i>General Area of Supply Related to Edmonton</i>
	miles	bbl./day	
Canadian Industrial Gas and Oil Ltd.....	82	15,000	southeast
Federated Pipe Lines Ltd.....	529	175,000	northwest
Great Canadian Oil Sands Limited.....	266	50,000	north-northeast
Gulf Alberta Pipe Line Company Limited.....	410	40,000	south-southeast
Imperial Pipe Line Co. Ltd.....	378	72,000	southwest
Interprovincial Pipe Line Co.....	31	110,000	northeast
Peace River Oil Pipe Line Co. Ltd.....	1,240	95,000	northwest
Pembina Pipe Line Ltd.....	931	154,000	west-southwest
Rainbow Pipe Line Company, Ltd.....	605	110,000	northwest
Texaco Exploration Company.....	173	111,000	south

In addition, three pipelines are connected to the Interprovincial at Hardisty, some 100 miles southeast of Edmonton. Here, Gibson Associated Oil Ltd. makes deliveries of up to 15,000 bbl. daily of oil from fields just south of the pipeline terminal. Husky Pipe Line Ltd. operates a multiple-line system in which one line is used to transport condensate from Hardisty to mix with the heavy, asphaltic crude found at Lloydminster. The condensate-crude blend is returned to Hardisty through an eight-inch line, and a new 10-inch line which was completed in 1969. Total capacity of these lines is 72,000 bbl. daily. The third pipeline connection, Bow River Pipe Line Ltd., carries crude from the most southerly oilfields in Alberta, near Taber; this line has a capacity of 27,000 bbl. daily. Home Oil Limited operates a pipeline serving refineries in the Calgary area with oil from fields north of the city; the line also has connections with the Rangeland pipeline which, in turn, is linked to the Texaco line going north to Edmonton. Also serving Calgary is the oldest pipeline in Alberta operated by Valley Pipe Line Company, which carries crude from the historically important Turner Valley in quantities up to 15,000 bbl. daily.

The Trans Mountain pipeline has a second receiving terminal in Alberta at Edson where the Peace River pipeline makes deliveries to Trans Mountain from fields to the north. In British Columbia, the Western Pacific Products and Crude Oil Pipelines Ltd. carries crude over a distance of 500 miles from fields near Fort St. John in northeastern British Columbia to the Trans Mountain pipeline at Kamloops; this line has a capacity of 66,500 bbl. daily.

Three main pipeline systems carry crude oil from Saskatchewan fields to the Interprovincial pipeline. The largest is the Westspur Pipe Line Company-Producers Pipelines Ltd. network, with a capacity of 175,000 bbl. daily, which delivers crude from the important southeast Saskatchewan producing area to the Interprovincial terminal at Cromer, Man., and also carries crude delivered to it by Trans-Prairie Pipelines Ltd. from fields in the Midale area of southeast Saskatchewan. In 1969, Producers Pipelines built a 56-mile line in southwestern Saskatchewan to connect the new Plato oilfield with Interprovincial at Kerrobert. The South Saskatchewan Pipe Line Company, with a capacity of 115,000 bbl. daily, takes medium-gravity crude from fields near Swift Current in southwest Saskatchewan to the Interprovincial pipeline at Regina. The third system is the mid-Saskatchewan pipeline of Royalite Oil Company, which has a capacity of 10,000 bbl. daily and carries crude oil from the Coleville-Dodsland area to the Interprovincial terminal at Kerrobert.

The Manitoba System of Trans-Prairie Pipelines Ltd. is the only pipeline in Manitoba serving the producing fields in the general area of Virden. It carries crude to the Inter-provincial terminal at Cromer and has a capacity of 27,000 bbl. daily.

Interprovincial Pipeline.—The system of Interprovincial Pipe Line Company is Canada's longest oil pipeline. It incorporates the wholly owned subsidiary in the United States, Lakehead Pipe Line Company Incorporated, and has a right-of-way length of 2,025 miles including a 95-mile lateral to Buffalo, New York. In a major expansion program undertaken in 1969, 170 miles of 34-inch pipeline were added in Western Canada, thus completing three complete lines between Edmonton and Superior, Wisconsin. In addition, 290 miles of 30-inch line were laid from the Chicago area to Sarnia, thereby providing two pipelines from Superior to Sarnia, one north of Lake Michigan and one to the south. The pipeline can deliver 30 grades of crude oil. Year-end capacities of the various sections of the pipeline are shown below for 1969 and for 1970.

<u>Section</u>	<u>1969</u>	<u>1970</u>
	bbl./day	bbl./day
Edmonton-Regina.....	633,000	1,001,000
Regina-Cromer.....	823,000	873,000
Cromer-Gretna.....	862,000	1,027,000
Gretna-Superior.....	821,000	983,000
Superior-Sarnia via Straits of Mackinac.....	536,000	538,000
Superior-Chicago.....	204,000	331,000
Chicago-Sarnia.....	—	306,000
Sarnia-Port Credit.....	281,000	287,000
Westover-Buffalo.....	79,000	90,000

Interprovincial serves 34 refineries: three at Edmonton; one at Lloydminster via the Husky pipeline; one at Saskatoon via Saskatoon pipeline from Mildred; one at Moose Jaw via B-A Saskatchewan pipeline from Stony Beach; two at Regina; two at Winnipeg via Winnipeg pipeline from Gretna, 17 in the United States either directly or through connecting carriers; three at Sarnia; two at Oakville; one at Clarkson; and one at Port Credit.

Trans Mountain Pipeline.—The system of Trans Mountain Oil Pipe Line Company extends from Edmonton to Vancouver via Jasper and has a right-of-way length of 780 miles, including a section of 57 miles in the United States which belongs to a wholly owned subsidiary of Trans Mountain. Trans Mountain serves eight refineries: one at Kamloops; four at Vancouver; and three in the Puget Sound region of Washington State. Under a contract with Gulf Oil Canada Limited, facilities were completed at the Vancouver terminal to handle storage and transfer of liquid propane from railway tank cars to refrigerated Japanese tankers. First loading under the 10-year contract was made in October 1966, and in 1969, 3,276,000 bbl. were delivered to tankers. Capacity of various segments of the system at the end of 1968 were:—

<u>Section</u>	<u>1968</u>	<u>Section</u>	<u>1968</u>
	bbl./day		bbl./day
Edmonton-Edson.....	310,000	Sumas-Ferndale.....	220,000
Edson-Kamloops.....	285,000	Sumas-Anacortes.....	235,000
Kamloops-Sumas.....	335,000	Sumas-Burnaby.....	335,000

Montreal-Portland Pipeline.—The Montreal refinery centre is served by a 236-mile pipeline which is a joint system of Montreal Pipe Line Company and its wholly owned subsidiary in the United States, Portland Pipe Line Corporation. This line takes delivery of tanker-borne crude from Venezuela, the Middle East and Africa at Portland, Maine. In 1965, the company completed a 24-inch pipeline alongside the existing 18-inch and 24-inch crude oil lines. An additional 24-inch line was completed under the St. Lawrence River in 1967 to serve the refineries in Montreal and, at the same time, 16- and 20-inch lines were installed for future use. Present capacity of the system is 504,000 bbl. daily.

Product Pipelines.—Traditionally, a product pipeline carries refined products from oil refineries to truck terminals in large consuming centres. However, with the growth of natural gas processing in Canada, which results in large volumes of products such as propane, butane and pentanes plus being produced, a new type of product line has emerged which carries these products to markets or to refineries.

There are three product lines in Eastern Canada, all supplying markets in Ontario with refined petroleum products. Two pipelines, Sun-Canadian Pipe Line Company and Sarnia Products Pipe Line, run from refineries at Sarnia to bulk plants in London, Hamilton and Toronto. Trans Northern Pipe Line Company, once a pipeline carrying products from Montreal to markets in Ontario as far west as Hamilton, now has a two-way flow. Products from Montreal are now delivered only in the area east of Brockville, including the Ottawa Valley; products from refineries west of Toronto are carried eastward as far as Kingston.

In Western Canada, the Petroleum Transmission Company pipeline carries propane, butane and pentanes plus from a plant at Empress in Alberta to Winnipeg in Manitoba, a distance of 578 miles. The predominant product carried is propane which is also marketed at various locations along the line. Elsewhere in Alberta, the Rimbey Pipe Line Company transports condensate from the Rimbey gas plant and takes deliveries from the Rangeland condensate pipeline to serve areas north of Calgary as far as Edmonton. Also going to Edmonton from the Leduc gas conservation plant are three pipelines owned by Nisku Products Pipe Line Company Ltd., one each for propane, butane and pentanes plus. Near Calgary, Home Oil Company operates a condensate pipeline to serve refineries there and also to make deliveries to the Rangeland condensate pipeline. In 1969, a 186-mile, 8-12-inch pipeline was built by Dome Petroleum Limited to transport mixed natural gas liquids from the Alberta Natural Gas Company's new gas reprocessing plant at Cochrane to Interprovincial's Edmonton terminal. The liquids will be transported to plants at Superior, Wis., and Sarnia, Ont., where they will be fractionated into propane, butane and other products for use in the surrounding market areas. There are other condensate pipelines in Alberta, most of which are associated primarily with production and do not serve end-users.

Pipeline Tariffs.—Typical of the charges to move crude oil are the following pipeline tariffs:—

	<i>Charge</i>	<i>Distance</i>
	cts./bbl.	miles
Edmonton to Vancouver.....	40.0	718
Edmonton to Regina.....	20.7	438
Edmonton to Winnipeg.....	32.7	847
Edmonton to Sarnia.....	48.0	1,743
Edmonton to Port Credit.....	51.0	1,899
Portland to Montreal.....	10.5	236

Natural Gas Pipelines.—Natural gas now accounts for about 19 p.c. of Canada's energy requirements and, in addition, large volumes are delivered to markets in the United States. Relatively small amounts of natural gas have been transported in other areas of the world as a liquid under refrigeration, and this method was utilized for the first time in Canada in 1967 to supply gas to the distribution system of the town of Squamish, B.C. However, most of the gas used in Canada, as well as in North America as a whole, is moved by pipeline. There is an extensive network of pipelines serving most centres of population from Vancouver to Montreal and delivering gas to several points of export on the United States border.

Since the mid-1950s when large-volume gas removal was authorized from Alberta, capital expenditures in gas pipeline construction have constituted a significant proportion of the country's total outlay for transportation facilities. In 1969, capital expenditures of \$279,000,000 were made and forecast expenditures for 1970 amounted to \$345,100,000,

bringing the cumulative expenditures for the period 1955-70 to an estimated \$1,934,500,000 for gathering and transmission systems, with an additional \$1,217,700,000 for distribution systems.

Pipelines are usually categorized under three headings—gathering lines, transmission lines and distribution lines. The gathering lines are those that take gas from the wells or separators to the field gate or some other specified point. Transmission lines are normally the large-diameter pipelines that take gas from gathering lines and deliver it to the distributors principally at the 'city gate'. In total, there were 54,942 miles of all types of gas pipeline in operation at the end of 1969, of which 6,549 miles were gathering, 17,197 miles were transmission, and 31,196 miles were distribution.

Unlike oil pipeline companies which are common carriers that transport oil for a fixed charge, gas pipeline companies, with few exceptions, own the gas that is transported. The principal exception is the Alberta Gas Trunk Line Company which delivers virtually all of the gas exported from Alberta to the provincial boundary where main transmission companies accept delivery. This is an important exception because most of the Canadian gas reserves are in Alberta. The Alberta Gas Trunk system contains 2,778 miles of pipeline.

Some details of the main transmission systems are contained in the following paragraphs. Like oil pipelines, there are two trunk lines serving Canada. One is the Trans-Canada Pipe Lines Limited system and the other is that of Westcoast Transmission Company Limited.

Trans-Canada Pipe Lines Limited.—The Trans-Canada pipeline, originating at the Alberta border near Burstall, Sask., follows a route eastward to a point near Winnipeg, Man., where it branches into two lines. One continues eastward into Ontario through Thunder Bay, then arches through the clay belt before swinging south via North Bay to Toronto, where one branch goes westward into Ontario and another follows the shore of Lake Ontario and the St. Lawrence River to Montreal and the United States border. A number of lateral lines extend from the main transmission line to serve communities along the route. The second line from Winnipeg goes south to the United States boundary at Emerson where it connects with the Great Lakes Gas Transmission Company system, which is jointly owned by Trans-Canada and an American company. This pipeline follows a route south of Lake Superior through the Straits of Mackinac and east of Lake Michigan to reconnect with the Trans-Canada system at Sarnia, Ont. The Trans-Canada system is Canada's longest pipeline, having a total mileage of 3,638 miles including loop lines. The maximum daily gas delivery through the system in 1969 was 2,298,000 Mcf. Export sales averaged 428,000 Mcf. daily.

Westcoast Transmission Company Limited.—The supply of gas for Westcoast comes mainly from fields in northeastern British Columbia but significant quantities are gathered in northwestern Alberta. The main line from Fort St. John runs in a southerly direction to Vancouver and to the United States border at Sumas, B.C. An extension to its system from the Fort St. John area to the Fort Nelson area permits the pipeline system to pick up gas from the main areas stretching from Dawson Creek to the Kotocho Lake area, north-east of Fort Nelson. Total pipeline in the Westcoast system exceeded 1,400 miles in 1969.

Alberta Natural Gas Company.—Although the Alberta Natural Gas pipeline is only 107 miles long, it forms a vital link in a major gas export scheme which carries Canadian gas as far south as California. The pipeline connects with Alberta Gas Trunk pipeline at Crownsnest Pass on the Alberta border and extends across southeastern British Columbia to the international border near Kingsgate where it meets the Pacific Gas Transmission Company system, which transports the gas in the United States.

Other Gas Pipelines.—There are many other natural gas pipelines operating in Canada. Some systems are devoted exclusively to gathering gas in producing fields, while others receive gas from the main transmission lines and distribute it to gas customers. Several

large systems combine elements of gathering, transmission and distribution. Among the larger systems, Inland Natural Gas Co. Ltd. distributes gas to a number of centres in interior and southern British Columbia. In west-central British Columbia, the Pacific Northern Gas Ltd. pipeline services communities and industries along a 435-mile route between the Westcoast main line at Prince George and the Pacific Coast cities of Prince Rupert and Kitimat. Canadian Western Natural Gas Company Limited and North-western Utilities, Limited serve markets in central and southern Alberta with a total of more than 7,200 miles of pipeline. The Saskatchewan Power Corporation delivers all gas sold in Saskatchewan; the 5,968-mile system transports and distributes gas to most of the populated areas of Saskatchewan. The Northern and Central Gas Corporation Limited has probably the most geographically widespread distribution system in Canada, as it distributes gas to industries and communities adjacent to the Trans-Canada system from Winnipeg as far east as the Montreal area. Two large utility companies serve the highly populated and industrialized areas of southern Ontario. The Consumers' Gas Company operates in the Toronto area, the Niagara peninsula and eastern Ontario while the Union Gas Company of Canada, Limited serves the southwestern corner of the province. These and many other systems make up the growing network of gas pipelines which serves domestic, commercial and industrial customers in all provinces except Prince Edward Island, Nova Scotia and Newfoundland.

Oil Pipeline Statistics.*—There were 45 oil pipeline companies operating in Canada at the end of 1969. Pipeline deliveries shown in Table 1 were made to non-pipeline carriers, foreign pipelines, and terminals including refineries and distributing centres.

Revenue and employee data shown in Table 2 are not complete; both revenue and employee figures have been omitted for some companies, since pipeline operation forms only a part of the activities of these establishments and the data are not separable. Daily average of net deliveries by trunk lines in 1969 was 1,846,880 bbl.; trunk lines barrel miles amounted to 319,983,661,000 and the average miles per bbl. to 475; other data for 1969 were not available at the time of printing.

* Statistics of oil pipelines are given in greater detail in the DBS monthly report *Oil Pipe Line Transport* (Catalogue No. 55-001).

Gas Pipeline Statistics.—As already stated, the natural gas transport industry became a significant factor in the Canadian economy in 1957 with the completion of the first of several extensive pipelines constructed to transport natural gas from the field or processing plant to distribution outlets. Consequently, the distribution industry also greatly increased deliveries to consumers from that time. Table 3 illustrates this expansion for the years 1966-69.

PART VI.—GOVERNMENT PROMOTION AND REGULATION OF TRANSPORTATION

The Federal Government plays a twofold role in the development of transportation services. One is the promotional role, ensuring the growth and development of the kind of transportation appropriate to the times; the other is a regulatory role, including economic regulation of rates and services and also technical regulation to meet safety requirements and for other purposes. Examples of promotion are the building of canals from the time of Confederation to the recent constructing of the St. Lawrence Seaway, the underwriting of railway development and branch-line extension, the establishment of Air Canada, the large investments in airports and aeronautical installations, and the building of the Trans-Canada Highway.

The Ministry of Transport and the various Crown agencies reporting to Parliament through the Minister of Transport have jurisdiction over canals, harbours, shipping, civil aviation and interprovincial and international railways. Interprovincial or international pipelines for carrying gas, crude oil or petroleum products are under the jurisdiction of the National Energy Board. Jurisdiction over for-hire interprovincial or international highway transport also rests with the Federal Government but these powers are at present exercised by the provincial highway transport boards under the federal Motor Vehicle Transport Act of 1954.

Railway regulation was developed in a period when railways enjoyed a virtual monopoly of transport in the country. Measures to protect the public against excessive charges, unjust discrimination and other objectionable monopoly practices, together with measures to ensure safe operations, have over the years subjected railways to the most comprehensive regulation of any Canadian industry. In the intervening years the rapid growth of road, air and pipeline services has ended the railway monopoly for a large part of the total traffic available and has placed the railways in a highly competitive situation.

A Royal Commission was appointed in 1959 to inquire into the railway rate structure and other problems. Its findings indicated a need to shift from regulating monopoly to maintaining a balance between the several competing modes of transport. Legislation based on the findings of the Royal Commission was passed by Parliament and received Royal Assent on Feb. 9, 1967. The statute, called the National Transportation Act, defines a national transportation policy for Canada looking to the achievement of an economic and efficient transportation system making the best use of all available modes of transportation at the lowest total cost. It established the Canadian Transport Commission to carry out the functions formerly performed by the Board of Transport Commissioners for Canada, the Air Transport Board and the Canadian Maritime Commission. In addition, the Act creates a framework within which the pipeline carriage of commodities other than oil and gas and the interprovincial and international motor transport undertakings can be regulated by the Canadian Transport Commission.

The general purpose of the Act is to create a situation in which the development of the transportation industry and the protection of the public against excessive or discriminatory charges are accomplished in the main by competition between modes rather than by regulation and control. The railways are relieved of some of the more onerous and outdated restrictions on their freedom to meet competition. On the other hand, a shipper who has no practical alternative to rail shipment can apply to have a maximum rate fixed for his goods by the new Commission. The Act also provides a procedure to allow the railways, under safeguards for the public interest, to abandon lines and withdraw passenger services where they are no longer needed.

The Canadian Transport Commission.—The Commission, created by the National Transportation Act (SC 1967, c. 69), was organized on Sept. 19, 1967 and succeeded to all the powers and duties of its predecessors, the Board of Transport Commissioners for Canada, the Air Transport Board and the Canadian Maritime Commission. The Commission is a court of record. It consists of a maximum of 17 members, of whom

one is president and two are vice-presidents. One of the vice-presidents is charged with the superintendence of the work of the committees of the Commission and the other is charged with the superintendence of the programs of study and research of the Commission. For the purpose of performing its duties the Commission must establish committees, any of which may, in accordance with the rules and regulations of the Commission, exercise the powers of the Commission. Three of these committees—the Railway Transport Committee, the Air Transport Committee and the Water Transport Committee—are at present functioning in respect of these several modes of transport. The finding or determination of the Commission upon any question of fact within its jurisdiction is binding and conclusive and no order or decision may be questioned or reviewed except on appeal to the Supreme Court of Canada upon a question of law or a question of jurisdiction with leave of that Court, or by the Governor in Council. However, a party to an application for a licence under the Aeronautics Act or the Transport Act may appeal to the Minister of Transport from a final decision of the Commission.

The Commission has jurisdiction under more than a score of Acts of Parliament, including the Railway Act, the Aeronautics Act and the Transport Act, over transportation by railway, by air and by inland water, and over communication by telephone and telegraph.

Railway Transport.—Under the Railway Act the jurisdiction of the Commission is, stated generally, in respect of construction, maintenance and operation of railways that are subject to the legislative authority of the Parliament of Canada, including matters of engineering, location of lines, crossings and crossing protection, safety of train operation, operating rules, investigation of accidents, accommodation for traffic and facilities for service, abandonment of operation and uniformity of railway accounting. The Commission also has certain jurisdiction over telephones and telegraphs, including regulation of the telephone tolls of Bell Canada and over tolls for the use of international bridges and tunnels.

Except for certain statutory rates, and subject to certain powers of the Commission to deal with rates that it finds to be contrary to public interest, the railways are free to charge rates as they wish. However, rates must be compensatory, and the Commission may prescribe tolls for captive shippers if such tolls take undue advantage of a monopoly situation favouring the railways.

Air Transport.—The Commission is responsible for the economic regulation of commercial air services in Canada and is also required to advise the Minister of Transport in the exercise of his duties and powers in all matters relating to civil aviation. The regulatory function relates to Canadian air services within Canada and abroad and to foreign air services operating into and out of Canada. It involves the licensing of all such services and the subsequent regulation of the licensees in respect of their economic operation and the provision of service to the public. The Commission issues regulations dealing with the classification of air carriers and commercial air services, accounts, records and reports, traffic tolls and tariffs, and various other matters. All regulations, rules and orders issued by the former Air Transport Board continue in force until repealed or amended by the Canadian Transport Commission.

On Oct. 20, 1966, the Minister of Transport tabled in the House of Commons a "Statement of Principles for Regional Air Carriers", which assigns to the Commission the responsibility for initiating measures to implement the policy set out therein. In this connection, the Commission has under review the route structures of regional air carriers.

The Commission takes an active part in the work of the International Civil Aviation Organization and, when appropriate, undertakes bilateral negotiations for the exchange of traffic rights. At present, Air Canada and CP Air are Canada's designated international scheduled carriers.

Water Transport.—Under the Transport Act, the Commission entertains applications for licences for ships to transport goods or passengers for hire or reward between places in

Canada on the Great Lakes and on the Mackenzie and Yukon Rivers, except goods in bulk on waters other than the Mackenzie River. Before granting a licence, the Commission must be satisfied that public convenience and necessity require such transport. The Commission also has regulative powers over tolls for such transport.

Shipping Subsidies.—The Canadian Transport Commission also administers subsidies paid by the Federal Government for the maintenance of certain coastal and inland water shipping services. Table 1 shows the net amount of steamship subventions paid in connection with contracts made for the maintenance of essential coastal and inland water shipping services in the years ended Mar. 31, 1968 and 1969.

The National Energy Board.—The National Energy Act (SC 1959, c. 46) proclaimed Nov. 1, 1959, provided for the establishment of a five-member Board charged with the duty of assuring the best use of energy resources in Canada. In the performance of this function, the Board is responsible for the regulation of the construction and operation of the oil and gas pipelines that are under the jurisdiction of the Parliament of Canada, the tolls charged for transmission by oil and gas pipeline, the export and import of gas and the export of electric power, and the construction of the lines over which such power is transmitted. The functions and operations of the Board are covered in the Domestic Trade and Prices Chapter of this volume, Part II, Section 4.

Section 1.—Telecommunications

Subsection 1.—Telecommunications Media*

Communications media in Canada have been shaped to meet the needs of the country. Great networks of telephone, telegraph, radio and television facilities, inextricably bound together, provide adequate and efficient service which, in this era of electronic advancement, is under continual technological change and development. The familiar challenges of the country—its size, its topography, its climate, its small population—which have reared their heads in other areas of development, have had to be faced as well in the field of telecommunications. That these have been met is evidenced by the fact that today Canada possesses communications facilities and services which are second to none in the world and which are somewhat unique in structure. On the one hand there is a group of telephone companies acting in concert to provide national services and on the other there are two railway companies providing services, each of which is national in scope. These companies provide a most comprehensive total telecommunications network and almost all Canadians from the Arctic Coast to the 49th parallel and from St. John's in Newfoundland to Vancouver in British Columbia can communicate with each other and with the rest of the world by the simple action of twisting a dial or pushing a button. Messages are carried by microwave, tropospheric scatterwave systems, land lines and high frequency radio bands. The great advancement in telecommunications during the past few years indicates that machine-to-machine communications will, within a very short time, surpass the volume of man-to-man communications. The use of computers is becoming more and more commonplace and the ability to transmit computer data from one location to any distant location across the country is a tremendous boon to industry and commerce and a benefit to every Canadian.

The vital importance of telecommunications to Canada was recognized in the creation of the federal Department of Communications in 1969. This brought together into a single ministry the Telecommunications Policy and Administration Bureau (formerly with the Department of Transport), the Defence Research Telecommunications Establishment, the

*Revised by Canadian National Telecommunications, Ottawa.

Canadian Overseas Telecommunication Corporation and the Canada Post Office. Initially, the Department has concerned itself with a comprehensive inquiry into all aspects of Canada's information system. This "Telecommission" study, as it nears completion, is providing the Department with guidance for the formulation of national communications policies and programs.

Public Telephone Service.—Telephone service, local and long-distance, is provided by telecommunications companies serving a total of almost 10,000,000 telephones across Canada. The largest serving organization is the Trans-Canada Telephone System comprising eight telephone companies, either privately or publicly owned—the Newfoundland Telephone Company Ltd., the Maritime Telegraph and Telephone Company Ltd., The New Brunswick Telephone Company Limited, Bell Canada, the Manitoba Telephone System, Saskatchewan Telecommunications, Alberta Government Telephones and the British Columbia Telephone Company. In addition, there are almost 1,900 independent telephone companies providing private service in smaller communities across the country, many of which link into the Trans-Canada Telephone System for world-wide telephone access. Each company has a monopoly within its own territory and is subject to government regulations at the appropriate level—federal, provincial or municipal.

CN Telecommunications, the largest single telecommunications system in Canada on the basis of area served, provides telephone service for residents in the Yukon and Northwest Territories, in parts of Newfoundland, and in northern sections of British Columbia. In all, there are some 35,000 subscribers on the CNT telephone network. Without exception, all CNT exchanges are of the automatic dial type. Subscribers in the Far North have access to the outside world via CNT-operated long-distance toll centres at Whitehorse, Y.T., Fort Nelson, B.C., and Hay River and Inuvik, N.W.T. In some areas, such as the Mackenzie River delta, short-haul long-distance calls are handled by automatic toll ticketing similar to that used by the large telephone companies in the major southern Canadian centres. A \$3,000,000 expansion program in Newfoundland will include 10 new telephone exchanges, extensions of 22 existing exchanges and the expansion of transmission facilities; many isolated settlements now have as modern a telephone service as any in Canada.

The latest telephone innovation is the electronic switching system and the touch-tone telephone, developed in the United States. The dial is replaced by push-buttons, each of which, when pressed, emits a tone that activates the exchange to contact the desired party. Electronic exchanges are now being used in many areas by the Trans-Canada Telephone System and CN-CP Telecommunications are using a similar touch-tone application in their Broadband Exchange Service (see p. 965).

Public Telegraph Service.—Canada's telegraph systems are operated by CN-CP Telecommunications. These companies operate telegraph offices, often amalgamated, in all 10 provinces and in the Yukon and Northwest Territories, and messages can be sent to and from any point in Canada or throughout the world via the overseas cable services (see pp. 979-980). At one time, much of the CNT and CPT revenue came from telegraph message traffic but the proportion now accounted for by such traffic is only about 20 p.c. Even so, the reduced telegraph message traffic is handled by the most up-to-date facilities. Messages are transmitted by teleprinter and facsimile equipment, and telegraph networks over which public messages flow are controlled by computers. In other words, messages are taken in and forwarded automatically in accordance with special programs stored in the computer's memory. The computer determines where the message is to be sent and sends it as soon as the circuits are free.

A recent experiment by CNT using cathode ray tube displays (CRT) in Toronto proved so successful that CRT display units were installed during 1970 at the larger centres of Edmonton, Winnipeg, Ottawa, Quebec City, Saskatoon, Moncton and Halifax. Even-

tually, units will be installed in all medium-sized centres and the Toronto centre will be expanded to include four more displays, bringing the total to 16. Basically, CRT displays have television-like screens placed above a keyboard similar to a typewriter which is connected to the message switching computer. As the operator receives a telephoned telegram message, she types it on the keyboard and it appears on the screen at the same time. She is able to read the message back to the caller and, with editing capabilities built into the displays, may make changes to the text if required. When the message is confirmed, the push of a button sends it into the message switching computer for transmission to its destination.

The cathode ray tube display system is being installed in all the large and medium-sized centres across Canada. A telegram message typed on the keyboard shows up on the screen and the push of a button sends the message on to its destination.

Telex Service.—Telex, by far the largest teletypewriter service in Canada, is provided by CN-CP Telecommunications. Its network of 20,000 subscribers in Canada interconnects with the Western Union Telex network in the United States and with European and world-wide networks of more than 372,000 subscribers. Telex is a direct distance dial teleprinter system which permits a subscriber to directly dial any other subscriber on the network. Two speeds are offered to customers—66 words a minute and 100 words a minute—at costs determined on a time-used and distance basis; there is no minimum charge.

TWX, similar to Telex, is provided by the major telephone companies. One transmission speed of 100 words a minute is offered on this service, the network of which consists of some 2,700 subscribers in Canada and interconnects with the American Telephone and Telegraph network of some 50,000 TWX subscribers and also with the European and world-wide Telex network outside the North American network.

A medium-speed Telex service is offered exclusively by CN-CP Telecommunications, operating in the speed range of up to almost 300 words a minute. The subscriber may own his computer or data sending-receiving equipment or may lease it from CN-CP. This service provides a direct dial interconnection with subscribers anywhere in Canada to achieve a medium-speed range transfer of data from one location to another. The monthly rates to subscribers are the same as the stand-speed Telex service, that is, are based on time used and distance. A six-level code, an eight-level code and punched computer cards can operate on the medium-speed service.

Broadband Exchange Service.—In 1967, CN-CP Telecommunications introduced an automatic switching system of the most advanced design, known as Broadband Exchange Service, which has moved Canada into a new era of extremely high quality and very rapid communications. It is the first such system to operate in Canada and the second in the world. Broadband has more than tripled the fastest conventional machine-to-machine transmission. Furthermore, it has the capability, upon customer demand, of transmitting computer data at 51,000 words a minute, or more than 50 times faster than the top speed reached by conventional switched networks. The Royal Canadian Mounted Police was the first organization to be tied into this supersonic network, using it for intricate and high-quality transmission of fingerprints, photographs and documents between headquarters at Ottawa and divisional headquarters at Montreal, Toronto, Winnipeg, Edmonton, Regina, Vancouver, Fredericton, Halifax and St. John's.

The name, Broadband Exchange Service, is derived from the actual system since subscribers eventually will be able to select various bandwidths, depending upon their communications needs. The broader the bandwidths, the faster the speed of transmission. CN-CP will offer four bandwidths: four and eight kilocycles for voice, facsimile and data (from 1,000 to 3,000 words a minute); 16 kilocycles for high fidelity radio program transmission and facsimile; and 48 kilocycles for high speed computer-to-computer data exchange (51,000 words a minute) and high speed facsimile. The four-kilocycle bandwidth is now operational and the other bandwidths will become available upon customer demand.

Transmission is carried by the CNT-CPT microwave system using frequency diversity techniques to provide a high degree of reliability. In other words, the transmission is carried twice both ways over different circuits at the same time, one being the back-up system for the other.

Each subscriber has in his office a voice-data subset—a most advanced telephone instrument which, with the flick of a button, can change from voice communication to transmission of computer data. The subset features push-button “dialling” and the customer, to reach a distant point, simply pushes the buttons in a series of seven digits. The first three digits pressed designate the distant exchange, the fourth digit indicates the desired bandwidth and the last three digits are for the line of the desired party. A re-ring button is included so that the customer may signal the distant party to revert to voice communication during or after sending computer data. A feature of Broadband is abbreviated keying, where customers may contact frequently called stations by pushing a two-digit code instead of the normal seven. Broadband will make distant connections, including keying time, within five seconds, or two seconds on the special “hot line” service. Actual connection time after keying or “dialling” is less than two seconds. Another feature of Broadband is conference calling, where a subscriber, by pushing a two-digit code, will automatically contact a pre-determined list of parties needed for the conference. Subscribers are charged on a “pay-as-you-use” basis.

Multicom Service.—This Service, offered by the Trans-Canada Telephone System beginning in 1969, is a medium-to-high-speed data transmission system designed for the data processing industry. It transmits data at a variety of speeds from 2,400 to 50,000 bits a second—or as high as 60,000 words a minute. Transmission speeds can be increased as the need becomes evident. The data may be prepared in the form of either punched cards, punched paper tape, magnetic tape, disc storage or facsimile for optical scanning. As in Broadband Exchange Service, the caller presses the first three numbers to identify the serving office and the class of service. The last four digits identify the station being called. The initial system is made up of three high-speed switching centres at Calgary, Toronto and Montreal and five medium-speed switching centres at Vancouver, Calgary, Winnipeg, Toronto and Montreal. These switching centres are located in existing telephone switching centres but are more sophisticated than the regular telephone exchanges.

Data-Phone Service.—The major Canadian telephone systems operate Data-Phone Service which transmits data from punched cards, tape or magnetic tape between two or

Communications circuitry is now micrologic and a resistor may be a minute impurity requiring the attention of an electronic engineer.

more machines or computers. It takes pulses from punched cards or tape-data machines and transforms them into tones which are sent over telephone circuits or leased private lines. The subscriber pays for the line used at regular long-distance rates. Data-Phone transmits at a speed of 1,200 bits a second or 1,000 words a minute.

Data-Line Service.—Data-Line Service was put into operation by the Trans-Canada Telephone System in late 1968, primarily for customers who wished to be connected to time-sharing computers. Using the normal telephone lines and exchanges, this service has the capability of transmitting computer data from 1,000 words a minute to a new offering in 1969 of 50,000 words a minute. The subscriber may use his own send-and-receive equipment or he may lease the equipment from the Trans-Canada Telephone System. Charges are based on a flat rate and depend upon the bandwidth used.

Wide Area Telephone Service.—Wide Area Telephone Service (WATS), operated by the Trans-Canada Telephone System, provides dial-type telephone communication from one WATS zone directly to another long-distance zone. In other words, the subscriber has a wider area that he may call directly without going through the long-distance operator or Direct Distance Dialling, and he may select any or all of the WATS zones he wishes. The customer has an access line to a dial exchange office for use only in originating WATS calls. INWATS, the reverse series to WATS, was introduced in 1969. Subscribers are charged a measured time-period rate and an additional hourly rate. The measured time-period is 10 hours of accumulated time in each month and the additional hourly rate applies to the time used above the measured time.

Hot-Line Service.—A new service offered in 1969 by CN-CP Telecommunications and Western Union is the Hot-Line Service where companies in Toronto or Montreal may talk to their offices in New York City by simply picking up the handset of the telephone. When a customer picks up his handset, the exchange equipment will seek out the proper telephone at the other end. If all the circuits are in use at the time of calling, the caller will hang up and as soon as a circuit is free the equipment will make the connection and ring the telephone set at each end. Subscribers are charged on a time-used basis.

Private Wire Teletype Systems.—A transformation has been gradually taking place in private wire systems. Most major Canadian firms with large communications requirements in years past found that private wire systems best suited their needs—that is, their own private teletype network rented to them by telecommunications companies. Although private wire services are still a significant part of business for the telecommunications industry, prime communications users who must communicate with many stations across the country have been moving to the newer computer-controlled transmission systems.

Computer-Controlled Transmission Systems.—CNT, CPT and the Trans-Canada Telephone System all have in operation store and forward message switching computers which control the flow of message traffic. CNT pioneered in the uses of message switching computers in Canada, having operated in this field since 1964. Trans-Canada Telephone System inaugurated a computer-controlled system in late 1968 and CPT put their system in operation in 1970. The telephone companies have switching centres located at Vancouver, Calgary, Edmonton, Regina, Winnipeg, Montreal and at Toronto, their primary centre. This computer-controlled system converts transmission codes and speeds and also determines where messages are to be sent.

CNT's system provides a switching medium for Air Canada, CP Air and CN administrative message traffic and also controls and transmits information on CN's reservation system. When a railway customer wishes to make a reservation, a computer card is

A section of CNT's Data Central at Toronto, where store and forward message switching computers control the flow of message traffic for Air Canada, CP Air, the CN, and commercial users.

marked and inserted into a card reader. Within seconds, a reply will return via a teleprinter confirming the reservation. Air Canada's "Notice to Airmen" (NOTAM) project is also handled by this system; particular flight plans, runway conditions and navigational aids are stored in Air Canada's computer and given out to pilots across the country when a special code is dialled on teletype machines. A third-generation computer installed for CNT in 1968 is performing major store and forward message switching functions for the Canadian Meteorological Service. When the computer finds a weather report from any one of the 175 DOT weather stations throughout Canada, it will tell the station equipment to transmit the report into the computer and it then determines where and at what time of the day the information is to be sent.

Commercial telegrams are switched across the country by CNT's third-generation message switching computer. This undoubtedly is the most important development in telegraph service since Morse.

A new service, introduced by CN-CP Telecommunications in 1970 and called TeleNet, uses central message switching computers. The TeleNet system concept is a number of subscriber networks controlled by these central computers. The message switching computer centres will handle many customers but each customer's network will be completely private. In its initial phase, TeleNet offerings will be confined to message switching and related features such as speed and code conversions, message storage and retrieval, high-speed data handling, interface with customer-owned computers and message refile. A single message may be transmitted for delivery to as many as 64 destination stations by one group routing indicator at one time. Two levels of priority are recognized by the computers. Messages marked "quick" are handled immediately by the system.

Message switching computers are located at CNT offices in Toronto and CPT offices in Montreal and all Canadian subscribers' switching requirements will be routed by one of these centres. Future plans call for switching computer centres at Vancouver, Edmonton, Winnipeg and Halifax. Three classes of service will be offered with TeleNet between customers with light, medium or heavy traffic volume requirements. Subscribers using the heavy and medium classes will have full access to the Telex network. Various options and capabilities of TeleNet will enable CN-CP to custom design a system to meet specific needs of individual subscribers.

Domestic Commercial Satellite Communications Facilities.—Increasing activity in the Canadian Arctic and sub-Arctic, where communities are being expanded and new ones formed, as well as forecasts of the telecommunications needs of all of Canada, prompted the telecommunications industry and the Federal Government to consider a domestic satellite system. In 1966, a proposal from Niagara Television Limited and the Power Corporation of Canada Limited was submitted to the (then) Board of Broadcast Governors for a satellite system to distribute television programs for a third national television network. In March of 1967, the Trans-Canada Telephone System and CN-CP Telecommunications proposed to the Government a domestic satellite telecommunications system to carry television, telephone calls, data and other telecommunications services. In that same year RCA Victor Company Limited issued a proposal giving definite design criteria for a communications satellite within the capabilities of Canadian industry. In 1968, the Northern Electric Company announced an agreement with Canadair Limited and Hughes Aircraft of California, to form a group interested in designing and building equipment for satellite communications. For some time this subject was also under study by the Department of Transport and the result of this study was presented to the Government in 1967. By July of 1967, an intense interest had developed in the potential of a domestic satellite system and the Prime Minister announced the creation of a Task Force, under the direction of the Science Secretariat, to advise on satellite policy in general and, in particular, on the use of satellite technology for domestic communications.

Following the release, on Mar. 28, 1968, of a White Paper based to a large extent on the recommendations of the Task Force on satellite policy, the Government of Canada established Telesat Canada by Act of Parliament (SC 1969, c. 51), which came into force by proclamation on Sept. 1, 1969, to establish Canadian Domestic Satellite Telecommunication Systems providing telecommunications services on a commercial basis. Telesat Canada is not a Crown corporation but is designed to be a commercial company to be owned jointly by the Government of Canada, the Telecommunications Common Carriers, and the general public, according to the provisions of the Act. The annual report of the company is tabled in the House of Commons by the Minister of Communications.

Plans are proceeding for a target launch date in 1972 of the first satellite, to be named *Anik*, an Eskimo word meaning "brother". The initial system, consisting of some 36 ground stations and two satellites, will be designed to provide television distribution in both English and French to many parts of Canada not now served by terrestrial facilities; to provide telephone communications in Northern Canada; and to supplement existing microwave systems serving Southern Canada. The satellites will be capable of simultaneous transmission of all these services from stationary orbital positions to virtually all of Canada in association with the ground stations. Present plans are to lease services to the Trans-Canada Telephone System, CN-CP Telecommunications and the Canadian Broadcasting Corporation.

When present plans materialize, Canada will be among the first nations in the world to operate a domestic commercial satellite communication system. The whole of Canada is visible in space from that part of the equatorial orbital plane lying between 96° and 116° West Longitude. This forms a 20°-arc and contains the satellite positions most desirable for Canadian domestic service. The satellite or satellites maintain a stationary orbit at an altitude of 22,300 miles which means that they will rotate with the earth every 24 hours and therefore at any particular time of the day be over the same spot on earth.

Basically, satellite communication is just one long microwave link. The clarity and strength of transmission provided by a satellite will be comparable to that of existing microwave systems; only with respect to time required for transmission from an originating earth station to a satellite and back to another receiving earth station will there be a noticeable difference. Because of the 22,300-mile altitude of the satellite, the two-way transit time will be about 600 milli-seconds or six tenths of a second. This delay will be of no concern for one-way transmission services such as television, but it must be taken into account in the case of two-way voice circuits. To minimize the time effects, there must be an avoidance of tandem connections on space facilities and, wherever possible, the operation of voice circuits with one direction via satellite and the other via ground facilities.

These first-generation satellites will end their life cycle about five years after they are put into operation and undoubtedly additional satellite capacity will be required by then. The scope, capacity and design of the second-generation Canadian satellite will depend on technical developments and traffic requirements during the intervening years. Canada's microwave, land-line and troposcatter systems will continue to be the backbone of telecommunications services for many years to come but satellite communications, properly integrated with land facilities, will make it possible to reach all areas to which service has not yet been economically feasible.

International Satellite Communications.—Since the *Telstar* satellite was launched in 1962, Canada has made use of international satellites to connect to broadcast systems in other continents. In 1964, Canada became one of the 20 charter members of *Intelsat*, the International Telecommunication Satellite Consortium, which now numbers 68 countries. Thus, Canada is a joint owner of *Intersat* satellites and participates in the global satellite system established by *Intelsat*.

Acting through the Crown-owned Canadian Overseas Telecommunication Corporation, Canada is currently using the *Intelsat* satellites for intercontinental telephone, data and television relays to and from the domestic communications systems of CN-CP Telecommunications and the Trans-Canada Telephone System.

Public and Private Commercial Microwave Facilities.—Canada, because of its population distribution and the vast areas served by microwave communication links, ranks second highest among the world's users of microwave communications systems on a per capita/per mile basis. Increasing demand for television outlets has necessitated the extension of microwave routes to provide interconnections for the CBC English and French and private networks and these routes have been extended to permit the transmission of colour television. With the use of more automated equipment by industry and various services, associated data and control information must be transmitted at rapid speeds over microwave radio-relay to widespread areas throughout the country.

Railways.—The Telecommunications Departments of the Canadian National and Canadian Pacific Railway Companies have placed in operation a microwave system extending from Montreal to the Pacific Coast, which is used for television, telephone and data relay purposes. They also operate microwave facilities linking the Province of Quebec with the Maritime Provinces and Newfoundland, and a major expansion of microwave facilities in Newfoundland has been undertaken by Canadian National Telecommunications (CNT). In addition, CNT has installed a microwave system between Alberta through the Yukon Territory to Alaska which carries telephone and data traffic and serves both civil and military organizations in the area. In co-operation with Alberta Government Telephone, a combination microwave and tropospheric scatter system connects Alberta and the Northwest Territories. This system also provides communication for civil and military use. A \$3,000,000 construction program was undertaken in 1970 by CNT which will provide a combination microwave-scatterwave system linking the Yukon Territory with the Northwest Territories. Microwave will be used from Whitehorse to Keno and a tropospheric scatterwave system will bridge the Richardson Mountains from Keno to Arctic Red River; from there, microwave will be used north to Tuktoyaktuk. A scatterwave system hurls transmissions up to the troposphere where they are bounced back to the next station some 600 miles away.

The Quebec North Shore Labrador Railways has developed a microwave system extending into northern Quebec to provide communication for mining operations and to serve some civil communication purposes. Ontario Northland Railways operates a microwave installation connecting northern Ontario and James Bay, also for purposes of military and civil communication. The Pacific and Great Eastern Railway makes extensive use of 6,000 Mc/s microwave facilities linking Vancouver with Prince George and Dawson Creek, B.C.

Telephones.—The Trans-Canada Telephone System consists of eight provincial and private systems collectively providing a transcontinental microwave system for the purpose of carrying telephone, television, data and other types of communication services. Extensive microwave systems are utilized within the respective provinces for civil and military communications or television relay purposes. Major expansion has taken place in each province, greatly increasing the number of areas served and system capacity for all types of communication requirements. Tropospheric scatter systems are employed to provide beyond-line-of-sight transmissions, especially to the Far North; these are used for both civil and military applications.

The telephone companies of the three Prairie Provinces are constructing a major microwave system extending from Winnipeg to Edmonton, to form part of a projected second transcontinental microwave system operated by the telephone companies. The British Columbia Telephone Company has installed a major trunk system from Prince Rupert to Prince George, which is linked through Prince George with the transcontinental system in the southern part of the province. A microwave system links Mill Village communication satellite earth station, near Liverpool, N.S., with the trunk route system of the Maritime Telegraph and Telephone Company.

Television.—The two main television interests in Canada—the CBC and CTV Television Network Limited—lease private microwave facilities for the relay of television

programs from coast to coast. In addition, studio transmitter links are used by various television stations where the television transmitter is situated some distance from the studio and interconnection is required. In sparsely populated areas, off-the-air pick-up signals from primary television stations are sometimes relayed via microwave to rebroadcasting sites. Microwave facilities are also used in connection with portable and mobile television pick-up where program material is intended for the main studio. Both network facilities and local studio transmitter links have been upgraded to enable the transmission of colour television.

Industrial.—Although many firms utilize public communication facilities on a lease basis, some organizations have installed private microwave systems to provide voice, teletype and control data for various purposes. The British Columbia Hydro and Power Authority, the Calgary Power Corporation, The Hydro-Electric Power Commission of Ontario, the Quebec Hydro-Electric Commission and Manitoba Hydro use a considerable number of microwave relay systems for important control and communication purposes. For example, Hydro-Quebec has greatly expanded its hydro power generating capacity and new microwave routes have been added to permit a central control of the various generating stations. The British Columbia Hydro and Power Authority has installed facilities to link the Vancouver area with Peace River, Mica Creek and the Bonneville Power Administration in the State of Washington, and also for system control in the Vancouver area. Ontario Hydro is constructing an extensive microwave system to provide important control, monitoring and communications with all their facilities in southwestern Ontario.

Expanded facilities at the Vancouver Stock Exchange, prompted by recent record-breaking trading, included the installation of ultra-modern sophisticated electronic communications equipment which provides a greater amount of information more accurately and much faster than was previously possible. Transaction information is now available only seconds after the trade takes place on the floor.

Instructional.—The Department of Communications has opened the 2,600 MHz. microwave band for use by the various educational authorities in Canada for an instructional TV system. Some systems have now been licensed and others are being planned. The largest system is located at Calgary and it provides TV communications to 24 schools.

Miscellaneous Radio Communication Services.—In addition to radio communication services provided by the Federal Government, extensive radio communication systems have been established in the provinces and territories, mainly for police, highway and forestry protection purposes. Municipal government departments continue to increase their use of radio to facilitate operations, particularly as a medium of communication with vehicles—police, fire, engineering, hydro, etc. Such services as taxi, heavy construction, ready-mix concrete, oil pipeline construction and operation, veterinarian and rural medical also make extensive use of radio for communication purposes.

Public utilities, power companies, provincial power commissions, oil exploration and mineral development organizations have expanded considerably their use of radio in both mobile and point-to-point radio fields.

The telecommunication companies provide an extension of land telephone service, by radio, to suitably equipped vehicles. This service is available in all major cities in Canada and along many of the nation's arterial highways. Restricted common-carrier mobile radio service (which does not permit interconnection with the over-all telephone system but only with specific dispatchers) is available in most major cities in Canada as well as in a number of smaller urban centres. It is provided by telephone companies as well as by other organizations. Low-power radio stations may be licensed to permit short-distance personal and private business radio-telephone communications.

Subsection 2.—Telephone and Telegraph Statistics

Telephone Statistics.—In 1969 there were 1,888 telephone systems operating in Canada compared with 2,067 in 1968; of these systems, 1,618 reported in 1969 and 1,772 in 1968. Co-operative systems in rural districts decreased in number from 1,615 to 1,486 in the same comparison and incorporated companies from 109 to 92. The largest of the incorporated companies, Bell Canada, which operates throughout the greater part of Ontario and Quebec and in Newfoundland and the Northwest Territories, served 62 p.c. of all the telephones in Canada in both years and the British Columbia Telephone Company, also shareholder-owned, served 9.9 p.c. of the total in 1969. The number of telephones in use continues to increase at the rate of about 6 p.c. annually.

1.—Pole-Line and Wire Mileage and Number of Telephones in Use, 1960-69

Year	Systems Reporting	Route Mileage	Length of Wire	Telephones in Use

Telegraph Statistics.—There were nine telegraph and cable companies operating in Canada during 1967 but, as already stated, telegraph service is provided mainly by the telecommunications departments of the two major railway companies (see also p. 964). The number of telegrams sent continues to decline year by year, giving way to other types of message transmission, but the number of cablegrams sent has been rising. The business of telegraph and cable companies appears to be changing from one of handling messages directly to one of leasing equipment for the transmission of messages by others. Revenues from the latter source have been rising over the past several years and have been the main factor in the steady advance in total operating revenues. Total cost of property and equipment for all telegraph and cable companies was \$545,694,618 in 1969, increasing from \$519,949,814 in 1968.

¹ Excludes commission operators.² Includes wireless messages and transatlantic Telex messages.

Subsection 3.—Federal Control over Telecommunications and Federal Civil Telecommunications Services*

Federal Control over Telecommunications

The Department of Communications was established on Apr. 1, 1969, under the authority of the Government Organization Act of that year. The duties, powers and functions of the Minister of Communications extend to and include all matters relating to telecommunications over which the Parliament of Canada has jurisdiction, not by law assigned to any other department, branch or agency of the Government of Canada; and the development and utilization generally of communications undertakings facilities, systems and services for Canada. He is responsible for the administration of the Telegraphs Act, the Radio Act, and the Canadian Overseas Telecommunication Corporation Act.

Telephone and telegraph companies incorporated under the Federal Parliament are subject to the jurisdiction of the Canadian Transport Commission in the matter of rates and practices under the provisions of the Railway Act. Previously the CTC regulated rates only in those cases in which a charge was made to the general public; recent amendments to the Railway Act extend the jurisdiction of this body to cover rates charged for private wire services as well. International telegraph and telephone communications are handled subject to the International Telecommunication Convention and its Regulations, or under regional agreements, or both. Overseas cables landed in Canada are subject to the External Submarine Cables Regulations under the Telegraphs Act.

Radiocommunications in Canada, except for those matters covered by the Broadcasting Act, are regulated under the Radio Act and Regulations, and the Canada Shipping Act and Ship Station Radio Regulations. Amendments to the Radio Act in the past year provide for the licensing of Canadian earth and space stations engaged in space communications services. Radiocommunications in Canada are administered in accordance with the International Telecommunication Convention and Radio Regulations annexed thereto; the International Civil Aviation Convention; and the International Convention for the Safety of Life at Sea. A number of Canadian-United States conventions and agreements are also in effect, such as: the Convention for the Promotion of Safety on the Great Lakes by means of Radio; the Convention relating to the operation by citizens of either country of certain radio equipment or stations in the other country; the Agreement relating to the Co-ordination and Use of Radio Frequency above Thirty Megacycles per Second; and the Television and FM Agreements. In addition, Canada is a party to the North American Regional Broadcasting Agreement.

*Prepared by the National Telecommunications Branch, Department of Communications, Ottawa.

Under the Broadcasting Act of 1968, the Canadian Radio-Television Commission issues licences for broadcasting undertakings. However, the licences are not issued unless the Minister of Communications certifies to the Commission that the applicant has satisfied the requirements of the Radio Act and regulations thereunder, and has been or will be issued a Technical Construction and Operating Certificate under that Act. Broadcasting undertakings include radio (AM and FM) and television broadcasting stations, community antenna television (CATV) systems, and network operations. The technical rules and procedures for the allocation of frequency channels and installation and technical operation of broadcasting station facilities are set forth in the Department's *Broadcast Procedures and Radio Standards Specifications*. These documents form the basis for determining the acceptability of applications for Technical Construction and Operating Certificates and for the control of the technical operation of broadcasting undertakings. The availability of the technical facilities for broadcasting is subject to the terms of the North American Regional Broadcasting Agreement, the Canadian-U.S.A. Television Agreement and the Canada-U.S.A. FM Agreements.

Telesat Canada, a Corporation created by an Act of Parliament, June 27, 1969, is responsible for Canada's proposed domestic communications satellite. It has a unique form of financing—the Government, designated Common Carriers, and the general public will each be offered about one third of its shares. The Corporation reports to Parliament through the Minister of Communications. (See also p. 969.)

Licensing and Regulation of Radio and TV Stations.—Licensing is the Federal Government's method of maintaining control over radiocommunications in Canada. Under the Radio Act, radio stations (other than those used in broadcasting undertakings) employing any form of Hertzian wave transmission, including television and radar, are required to be licensed by the Department of Communications, unless exempted by regulation. There are six classes of radio station licence: Coast, Land, Mobile, Ship, Earth and Space. Various categories of service may be authorized under each of these classes; for example, Public Commercial Service, Private Commercial Service, Amateur Experimental, etc. The number of licences in force for radio stations in Canada in the year ended Mar. 31, 1969 was 229,785 compared with 219,590 in 1967-68. These figures include stations operated by federal, provincial and municipal government departments and agencies, stations on ships and aircraft registered in Canada and stations in land vehicles operated for both public and private purposes, but they do not include stations in the broadcasting service. Following are comparative figures for the licensing periods 1967-68 and 1968-69:—

<i>Item</i>	<i>1967-68</i>	<i>1968-69</i>
New applications received.....	30,878	28,823
Authorization granted.....	28,279	27,454
Licence amendments.....	34,985	24,431
Licence cancellations.....	10,970	17,093
Total licences in force.....	219,590	229,785
Net increase in licences in force over preceding year.....	27,741	10,195

Radio Standards in general are drawn up in consultation with the electronic industry and users of radio, taking into account such technical factors as those which affect frequency spectrum utilization, reliability of apparatus, and compatibility under conditions of service. To facilitate the development of standard specifications, and for testing necessary to determine whether apparatus complies, the Department of Communications maintains an engineering laboratory.

Licensing involves the assigning of specific frequencies to each station. Bands of frequencies are allocated for various types of services, often on a shared non-interference basis. Frequency selection, compatibility evaluation, recording and notification with the International Frequency Registration Board (IFRB) of the International Telecommunications Union at Geneva are carried out to ensure efficient use of the spectrum. Assignments are made in keeping with international and domestic statutes and regulations, regional

agreements and domestic policies. The IFRB is notified of frequency assignments for technical examination and for inclusion, with appropriate "in-service" dates, in the international frequency list so that Canadian assignments will receive international recognition and be given protection from interference by foreign stations. "In service" dates are necessary when determining prior right to the use of particular frequencies.

The enforcement activities of the Telecommunications Regulation Branch, Department of Communications, include the technical inspection of all radio stations including the monitoring and measurement of their radiated signals to ensure compliance with the regulations and conditions of licensing; the location and suppression of radio interference; the technical examination of candidates for the various classes of certificates of proficiency in radio which must be held by the operators of radio stations; and the direction of prosecutions in the courts. These functions are carried out through personnel located at 34 radio regulations inspection offices, 10 fixed monitoring stations, seven mobile monitoring vehicles, and six regional spectrum observation centres across Canada. Through decentralization, the six regional offices share with headquarters in the direction of day-to-day activities of the Telecommunications Regulation Branch, and the development of suitable programs and facilities for the recruitment and training of necessary technical personnel for the Department.

Federal Civil Telecommunications Services

The Department of Communications is made up of the Communications Research Centre formed from the Department of Defence Research Telecommunications Establishment, the Telecommunications Management Bureau transferred from the Ministry of Transport, and the Policy, Plans and Programs Branch. The work of the Research Centre ranges from fundamental studies on materials and circuits to the design of advanced high-reliability avionics and aerospace electronic systems. The Telecommunications Management Bureau is responsible for: (1) development of policy and plans with respect to national and international telecommunications by satellites, cables and other media including relations with the Canadian Overseas Telecommunications Corporation and participation in the work of the International Telecommunications Union and its subsidiary organs; (2) establishment and review of the telecommunications requirements of the Federal Government departments and agencies throughout Canada, and co-ordination of the planning and provision of facilities to meet these needs; (3) planning of emergency measures and administration of the Emergency National Telecommunication Organization (ENTO); (4) development and maintenance within the Bureau of a centre of competence in the latest telecommunications technology; and (5) administration of the Radio Act and Regulations including allocation and assignment of radio frequencies, radio provisions of the Canada Shipping Act, Ship Station Radio Regulations, the Telegraphs Act and the Regulations thereunder covering the licensing of transoceanic cables.

Radio Aids to Marine and Aeronautical Navigation.—Federal services in aid of marine and aeronautical navigation are outlined in the following paragraphs; details may be obtained on request from the Ministry of Transport, Ottawa. Six regional offices, located at Vancouver, B.C., Edmonton, Alta., Winnipeg, Man., Toronto, Ont., Montreal, Que., and Moncton, N.B., carry out the construction and operations of the facilities.

Marine Navigation.—Radio aids to marine navigation are provided for radio-equipped Canadian vessels and foreign ships using Canadian waters. This safety and communications service for shipping covers the East and West Coasts, the Great Lakes, the St. Lawrence River and Gulf, Hudson Bay and Hudson Strait and includes regularly broadcast weather reports, storm warnings and notices of danger to navigation. Ships at sea may obtain medical advice from any coast station. The stations carry out communications by radiotelegraph and/or radiotelephone and most of them provide connections to land telephone

lines. Halifax (VCS) and Vancouver (VAI) stations provide long-range radiotelegraph and radiotelephone services to ships. Coast stations on Hudson Bay and Hudson Strait, in addition to their regular services, provide commercial communications for posts of the Hudson's Bay Company and various prospecting and development organizations, make weather observations, handle administrative traffic and assist aircraft with information, landing conditions, etc.

Automatic radiobeacon stations are maintained on the East and West Coasts, the St. Lawrence River and Gulf, the Great Lakes and Hudson Bay and Strait, giving navigational aid to mariners by transmitting signals on which bearings may be taken. These stations are arranged, where possible, in groups up to a maximum of six stations transmitting in sequence on a common frequency, the sequence being repeated continually regardless of weather conditions.

Loran is a long-range radio aid to marine and air navigation providing accurate fixes at distances up to 750 miles by day and 1,500 miles by night. Two Loran stations operate in Nova Scotia, three in Newfoundland and one on the West Coast. These stations, in conjunction with Loran stations of the United States Coast Guard, give service to ships and aircraft plying the North Atlantic and Pacific Oceans. *Decca* is a short-range radio aid to navigation providing accurate fixes at distances up to 250 miles. Four chains of Decca stations are in operation—the Newfoundland chain, the Nova Scotia chain, the Anticosti chain, and the Cabot Strait chain—giving service to ships off Newfoundland and Nova Scotia and in the St. Lawrence River and Gulf.

It has become general practice to equip merchant ships with radar and important buoys are fitted with radar reflectors to increase their radar visibility. A shore-based radar installation is in operation on the Lion's Gate Bridge across the entrance of Vancouver Harbour. A radar transponder beacon is in operation during the navigation season at Tuktoyaktuk, N.W.T. Low power transceivers are provided for use in emergencies at lighthouses, particularly at locations that would otherwise be completely cut off from assistance in case of illness.

Aeronautical Navigation.—Radio aids to air navigation are provided by the Ministry of Transport from coast to coast and from the United States border to the Arctic regions for use by Canadian aircraft and foreign air carriers flying over Canadian territory.

Low frequency radio aids operating on the frequency band 200-415 KHz are generally located within a distance of 50 to 100 nautical miles of each other to form the low frequency airways system. A few are located "off airways" in remote regions and a number of low power radiobeacons serve major airports as terminal and landing aids. The Ministry of Transport operates 275 en route, low frequency aids (28 of which are the older type radio range class) and 56 low power terminal radiobeacons. These facilities are used primarily in association with airborne direction finding equipment. Voice channels on a number of low frequency aids are also used for aircraft communications and weather broadcast purposes.

Operating on the higher frequency bands VHF (very high frequency) and UHF (ultra high frequency), the Ministry of Transport operates 55 VHF Omni-directional Ranges (VOR), 56 Instrument Landing Systems (ILS) and 30 Tactical Air Navigation Systems (TACAN).

The VOR stations form the VHF airways system which closely parallels the older low frequency airways system. Use of the VOR permits a pilot to select any desired course. Additional VOR stations are being constructed on a continuing basis. TACAN stations are collocated with the VOR at 30 locations. The TACAN provides the pilot with a readout of the distance of the aircraft from the VOR station. The complete station is called a VORTAC.

Instrument Landing Systems (ILS) provide radio signals which permit aircraft landings during periods of low visibility. Radio transmitters provide lateral and slope guidance to the approach end of the runway and also provide an indication of the distance to the runway

threshold. For air traffic control purposes, there are three main classes of radar in operation at Canadian airports consisting of: 16 airport and airways surveillance radars (AASR) with a range of 150 nautical miles; seven airport surveillance radars (ASR) with a range of 50 nautical miles; and nine precision approach radars (PAR), which are short-range radars used for landing at major airports.

Radiotelephone communications are provided by 117 ground stations. From these stations, a pilot may obtain weather data, air traffic control instructions and other information concerning flight safety. These stations operate for the most part on the very high frequency (VHF) band but in the north and on international routes high frequency (HF) is utilized to provide the necessary long-range coverage. Fourteen of the 117 stations engage in international communications services for Canadian and foreign air carriers. All these ground stations are connected to a fixed teletype network with over 48,000 circuit miles provided to meet aeronautical communications needs.

Meteorological Communications.—Weather stations operated by the Canadian Meteorological Service of the federal Ministry of Transport are linked coast-to-coast by means of teletype and, in the remote northern areas, by radio or radioteletype. These and other services provided by the Meteorological Service are described in detail at pp. 30-34.

Subsection 4.—Overseas Telecommunications Services

The Canadian Overseas Telecommunication Corporation was established in 1950 to maintain and operate external telecommunication services for the conduct of public communications by cable, radiotelegraph and radiotelephone and any other means of telecommunication between Canada and overseas points; to make use of all developments in cable and radio transmission and reception for external telecommunication services; and to conduct investigation and research with the object of improving and co-ordinating such telecommunication services with the telecommunication services of other nations.

The services currently being provided are as follows: direct telegraph, telephone and telex communications between Canada and Argentina, Australia, Austria, Barbados, Belgium, Bermuda, Brazil, Britain, Chile, Cyprus, Denmark, Finland, France, Germany, Greece, Hong Kong, the Irish Republic, Iceland, Israel, Italy, Jamaica, Japan, the Netherlands, New Zealand, Norway, Peru, the Soviet Union, Sweden, Switzerland and Trinidad and Tobago; direct telephone and telegraph services with the Islands of St. Pierre and Miquelon; direct telephone with Antigua, South Africa and Spain; and direct telex with Portugal and the Philippines. Datel 600 service is in operation between Canada and Britain and Switzerland. International telex service is provided with 160 countries.

The first transatlantic telephone cable, a joint project with the British Post Office, the American Telephone and Telegraph Company, Eastern Telephone and Telegraph Company and the Corporation, was brought into service in 1956. Since 1961, the following cables have been brought into service: the Canada-Greenland-Iceland 24-circuit telephone cable (ICECAN)—a two-party enterprise of the Great Northern Telegraph Company of Denmark and COTC; the Canada-Britain 80-circuit telephone cable (CANTAT); the Commonwealth Trans-Pacific 80-circuit cable—a four-party enterprise of Canada, Britain, New Zealand and Australia, connecting Vancouver and New Zealand and Australia via Hawaii and Fiji (COMPAC); the South East Asia Commonwealth 80-circuit cable—a six-party enterprise of Canada, Britain, New Zealand, Australia, Malaysia and Singapore, connecting Australia, Hong Kong, Singapore and Kuala Lumpur via New Guinea and Guam (SEA-COM), the CANTAT, COMPAC and SEACOM cables collectively forming part of the round-the-world Commonwealth Telephone Cable System; and a number of circuits for

Canadian purposes have been acquired in telephone cable systems connecting Bermuda and the United States and Jamaica and the United States. Currently under construction is a large-capacity telephone cable between Nova Scotia and Bermuda (CANBER).

The Corporation also operates direct circuits via the Atlantic satellite with Argentina, Austria, Belgium, Brazil, Britain, Chile, Denmark, France, Germany, Greece, Italy, the Irish Republic, Israel, the Netherlands, Peru, Spain and Switzerland. The earth station constructed for the Ministry of Transport at Mill Village, N.S., for research and experimentation with respect to satellites was brought into service in 1966 for commercial use and carried 240 telephone circuits for North American-European traffic via INTELSAT I (Early Bird). The Corporation's own earth station, Mill Village 2, came into service in March 1969 and operates with the larger capacity satellites of the INTELSAT III series, which have replaced INTELSAT I. The experimental station serves as a standby for commercial operation purposes. The Corporation at present operates direct circuits via the Pacific Satellite with Australia, Hong Kong and Japan through the American-owned earth station at Jamesburg, California, pending the erection of its own earth station on Vancouver Island.

Apart from normal use of its system for public telephone, telegraph message traffic and telex service, capacity is available for private leased circuits.

Canada, represented by Canadian Overseas Telecommunication Corporation, is a member of the Interim Communications Satellite Committee (ICSC) set up by the participating nations for the development and operation of a global communications satellite system. The Corporation also represents Canada on the Commonwealth Telecommunications Council.

The Corporation, under a long-term agreement, has under charter from the Ministry of Transport the CCGS *John Cabot*, a combined ice-breaker/cable repair ship, used mainly for repairing the cables in the western North Atlantic Ocean. The Corporation also operates a cable depot at St. John's, Nfld.

¹ Twin cable from Clarenville, Nfld. to Oban, Scotland, and single cable from Clarenville, Nfld. via Terrenceville, Nfld. to Sydney Mines, N.S.

² Licensed for operation by two carriers—COTC and ET&T.

Increased use of all types of overseas telecommunication services resulted in the COTC reporting a net profit of \$6,132,444 for the year ended Mar. 31, 1970. Income for the year amounted to \$33,155,103.

Section 2.—Radio and Television Broadcasting*

Since the opening program from the first radio station was beamed into a few Montreal homes in 1918, radio and television programming has become a prominent part of daily life of almost every Canadian. To have become such a force in the life of the nation, broadcasting had to learn the needs of the people and how to serve them. Two official languages forming two distinct cultures had to be served independently and dozens of other smaller groups, distinct in culture and frequently dwelling in the same radio or TV coverage area but in separate communities and with divergent program interests, also had to be served. Physical problems of distance and geography had to be overcome. It requires some hundreds of radio transmitters and TV stations and satellites to reach a population distributed across a 4,000-mile southern frontier, through seven time zones and a variety of topographical and climatic regions, and scattered northwest through thousands of square miles to the shores of the Arctic Ocean. Not only do these people have local service that is a reflection of life in their own districts but, by means of thousands of miles of land-lines for radio networks and microwave circuits for television, nearly every Canadian may, at the same time, listen or watch as an event of national or international interest takes place.

The broadcasting system in Canada comprises public and private components. The basic principles for broadcasting, both radio and television, are laid down in the Broadcasting Act of 1968, with the direction of broadcasting in the hands of the Canadian Radio-Television Commission (CRTC). The Commission, established in 1968 to replace the Board of Broadcast Governors, regulates and supervises all aspects of the broadcasting system, except for technical matters relating to the planning for and the construction of broadcasting facilities for which the Minister of Communications is responsible. An applicant for licence to establish and operate an AM, FM or TV broadcasting station, a community antenna television system (CATV) or a network files completed application forms with the Secretary of the CRTC. If found technically acceptable by the Commission, a public notice is issued in the *Canada Gazette* and in one or more newspapers of general circulation within the area served or to be served by such station or system. The same procedure applies to an application for renewal or amendment of an existing licence. The CRTC is composed of five full-time Commissioners and ten part-time Commissioners representative of the various regions of Canada.

The Canadian Broadcasting Corporation, a publicly owned corporation established by Act of Parliament, provides the national broadcasting service in Canada. Its radio and television facilities extend from Atlantic to Pacific and into the Arctic Circle. The CBC, created in 1936 to replace an earlier public broadcasting agency that had operated since 1932, is financed mainly by public funds voted annually by Parliament but supplementary revenue is obtained from commercial advertising (see p. 986). Head office is in Ottawa and the main production centres are in Toronto for English networks and in Montreal for French networks. Regional centres operate across the country.

Radio.—Despite the impact of television, radio remains an important means of communication for Canada's population, although its role has changed considerably. The CBC networks continue to provide a wide variety of programming to a national audience but much of the listening is concentrated on the large number of private local stations. The focus of attention has shifted from the group-listening that prevailed in pre-television days to the individual listener in the home, the automobile or out-of-doors. Programming has also changed, much attention now being given to music, news and weather and to a style that is intimate, relaxed and spontaneous.

Of all households in Canada, 97.4 p.c. are equipped with radio. In about half of them there is more than one set and often, in addition, there is a radio in the car and one or more portable transistor sets. It is estimated that there is about one radio set for every two persons. To serve this audience, there is an English-language and a French-language radio network, both operated by the CBC, and also a considerable number of privately owned

* Prepared by the Canadian Radio-Television Commission.

radio stations, some affiliated with the CBC networks and some serving an entirely local function. Of the 312 AM stations in operation, 34 are owned by the CBC and 278 are privately owned. The English network consists of 26 CBC stations and 61 private stations affiliated with it; the French network is made up of seven CBC stations and 34 private affiliates. The more than 200 unaffiliated private radio stations perform a basically local community service. Of the 77 FM stations, six are operated by the CBC and 71 are privately operated. The private stations are financed entirely from advertising revenue.

In addition to a coast-to-coast English network and a French network that reaches a large proportion of the country's French-language population in eight of the ten provinces, the CBC provides regional and local services. Its networks extend over more than 21,000 miles. It has its own news service and offers a wide variety of programs in information, public affairs and entertainment. Three special services—the international service, the northern service and the Armed Forces service—are outlined on pp. 984 and 985.

Television.—Television programming began in Canada in 1952. Of 5,460,000 households in the country, 5,250,000 are equipped with one or more television sets. Colour broadcasting, which began in 1966, is rapidly gaining in popularity. Of three television networks, two are operated by the CBC, one in English and one in French. The 5,000-mile microwave network that links St. John's in Newfoundland to Vancouver Island and the Pacific Northwest is one of the longest in the world. The second English network, CTV, is composed of 16 privately owned stations and 30 affiliated stations; it reaches over half of the homes that have television in Canada and continues to increase its coverage.

As of June 1970, Canada had 128 originating stations, including 18 frontier package stations, and 232 rebroadcasting transmitters. The CBC owned and operated 59 stations and 52 rebroadcasting transmitters and provided a substantial proportion of its national programming service through 48 privately owned stations which, with their 144 rebroadcasting stations, were affiliated with it. Six private stations are not affiliated with any network.

From the start, the development of Canadian television was complicated by geographical and language factors. About 50 p.c. of the people of Canada live near the United States border and have available to them programs broadcast by one or all of the major United States networks. This fact and the need to maintain a Canadian identity and to articulate Canadian interests contributed to the rapid development of Canadian television services. It was also important that French-language television services be quickly developed for that considerable portion of the Canadian population whose mother tongue is French. As a result of this rapid development, Toronto and Montreal rank among the world's principal television production centres in the English and French languages, and Vancouver, Winnipeg, Ottawa, Quebec, Halifax and St. John's have become regional production centres. Of the 17 CBC stations, 12 broadcast in English and five in French. Of the 59 private stations, 33 English-language and nine French-language stations are affiliated with the CBC. There are 12 private English-language stations affiliated with the CTV network and one English-language and three French-language stations operate independently.

Canadians at present view live television programs from overseas by means of United States communication satellites but in 1969 Telesat Canada, an organization jointly owned by the Government, the common carriers and the public, was established for the purpose of putting a Canadian satellite in space (see p. 969).

Cable.—Basically, cable television is an antenna system linked to the individual subscriber's set by cable through a series of amplifiers, making it possible to bring the subscriber signals he could not otherwise obtain. Cable systems are also capable of carrying FM and AM radio signals. For this service the subscriber customarily pays an installation fee and a monthly rental of about \$5 a month. Systems range from those with a few hundred subscribers to several with more than 30,000. Annual revenues of the cable systems at present run between \$50,000,000 and \$60,000,000 a year and are growing rapidly.

Cable television is recognized as part of the Canadian broadcasting system and policies and regulations that concern it must take into account the effects on other aspects of the system. Cable systems (CATV) are operated by private companies each of which must be approved technically by the Department of Communications and licensed by the CRTC. The Commission recently decided to not license broadcasting receiving undertakings based on the use of microwave or other technical systems for the wholesale importation of programs from distant United States stations and thereby the enlargement of the Canadian audience and market areas of United States networks or stations, but to give particular attention and help develop original programming. This decision rested on the conviction that there is in Canada the talent and the ability in the various fields of expression and knowledge to make effective use of a complex communication system.

According to CRTC policy, cable television systems must give priority to Canadian network signals, independent Canadian stations and locally originated programming, including educational broadcasts. Non-Canadian channels have a lower priority. Advertising is not permitted on cable systems, except advertising that is part of TV station broadcasts picked up by the system. The expenses of local programming must come from subscriber revenue.

As of Sept. 1, 1969, there were 317 cable television systems operating in Canada, serving 22.6 p.c. of all urban households in the country. This coverage represented a 45-p.c. increase over the preceding year.

Operations of the Canadian Broadcasting Corporation, 1969-70*

Programming.—In 1969-70 the CBC began to implement plans for an increase in Canadian programming. Although CBC schedules had always been predominantly Canadian, the rising costs of television had led to a greater dependence on commercial revenue, and thus to prime-time scheduling on the English network of many of the mass-appeal United States entertainment programs which are attractive to advertisers. The 1970 schedules of the CBC's English television network included an additional seven hours a week of Canadian production, more than meeting the new "Canadian content" requirements announced by the CRTC. The CBC planned to continue providing additional Canadian programs throughout its schedules over the next five years.

Among programs of particular interest during 1969 and 1970 were sports events such as the NHL hockey playoffs, CFL football, the Canada Summer Games, Montreal Expos baseball and the Commonwealth Games in Edinburgh; wildlife and conservation programs both in regular series and in specials such as "The Dying Waters"; news and documentary features on China, Viet-Nam, the Canadian North, the Quebec Liberal leadership convention and the Quebec provincial election; live coverage from Japan of Canadian participation in Expo 70; and programs on the Manitoba Centennial celebrations and the Royal visit to the Northwest Territories and Manitoba. Special events relayed through other broadcasters included the Apollo moon missions and landings, and the investiture of the Prince of Wales. Colour telecasting was increased during the year to an average of 55 hours weekly on the English network and 51 hours weekly on the French network.

In radio, the CBC conducted a comprehensive study of its French and English services, and recommendations for changes to meet the needs of the 1970s were submitted to the CBC Board of Directors.

The CBC continued to be the major employer of Canadian talent. During 1969, the Corporation's programs involved almost 30,000 Canadian artists, musicians, commentators, actors, actresses, and other performers. For these engagements the CBC paid out about \$20,500,000 in talent fees.

The CBC Northern Service continued its medium and shortwave radio service to the people of the Canadian North, and steadily increased its special programming for Indians

*Revised by the Supervisor of Audience Services of the Canadian Broadcasting Corporation.

and Eskimos, much of it in their own languages. Television in the North remained limited to the larger communities, served by means of videotaped program packages until the launching of the first Canadian communications satellite, *Anik*, expected to take place within a few years (see p. 969). The CBC Board of Directors visited Northern Service stations at Inuvik and Yellowknife in July 1970 and held public meetings to discuss the CBC service with local residents.

The CBC Armed Forces Service provided radio and television programs for Canadian forces personnel in Europe, Cyprus, Northern Canada and ships at sea, and arranged a number of visits to Canadian Forces bases in Canada and abroad by groups of Canadian entertainers. Parts of the stage shows presented at these concerts were recorded and filmed for later broadcast.

Facilities and Coverage.—Nearly all Canadians are within reach of the CBC's national broadcasting service; CBC radio is available to about 98.6 p.c. of the population and CBC television to about 96.6 p.c. The total number of public and private stations making up the CBC radio networks was more than 360 at Mar. 31, 1970. Outlets for the CBC television networks totalled more than 300. In those communities still unserved, the CBC hopes to provide service as quickly as financial and technical resources permit.

During 1969-70, the CBC put into operation 17 new television transmitters, including nine Frontier Coverage Packages providing taped service to isolated northern communities, and 19 new radio transmitters. Privately owned television stations were purchased in Moose Jaw and Regina, enabling the CBC to provide full English network service and some local programming in southern Saskatchewan. Stereo broadcasting was introduced on CBO-FM, the Ottawa station of the CBC-FM network. French-language television service was extended to Edmonton with the opening in March 1970 of CBXFT, which also leased part of its program time for local educational programming in English. French-language radio service was introduced in the Windsor area of Ontario through CBEF, which opened in May 1970. A licence was granted for the CBC to provide and operate the technical facilities for a UHF television station in Toronto, opening in the fall of 1970, which would transmit educational programs supplied and paid for by the Ontario Department of Education.

Transmission and studio facilities were improved at a number of CBC locations, and work was in progress on a new production centre at Moncton. Construction was well advanced at Place de Radio Canada, future site of the CBC's scattered Montreal facilities. Plans for the expansion of shortwave transmission facilities at Sackville, N.B., were changed in the light of financial circumstances, and only two of the planned five new transmitters were expected to be operational by the original target date of 1971.

Negotiations were pursued with the newly created corporation Telesat Canada regarding the technical and financial aspects of CBC use of the planned Canadian domestic satellite system.

Organization.—As part of a gradual administrative reorganization, CBC began the consolidation of its domestic broadcasting operations into two main language divisions: the French Services Division, centred in Montreal and responsible for domestic French-language operations in all locations; and the English Services Division, centred in Toronto and responsible for all domestic operations in English. Formal implementation of the change began in April 1970. The heads of these two divisions, and of the External Services Division formed earlier, report to the Executive Vice-President at the CBC head office in Ottawa. Another organizational change in progress was the design of a computer-based Management Information System and a complementary PPBS (planning, programming and budgeting system) to increase the efficiency of CBC operations. In March 1970, CBC employees numbered about 8,950, a reduction from the previous year.

External Services.—During 1969-70, the CBC International Service (IS) marked its 25th anniversary. Daily shortwave broadcasts in 11 languages and totalling about 90 program hours a week were beamed to Eastern and Western Europe, Africa, Australasia, Latin America, the United States and the Caribbean. They attracted an increasing volume of audience mail, and the quarterly program schedule was distributed to some 160,000 listeners. For the third consecutive year, the German broadcasts of the IS were voted the most popular in the world by the Association of German Shortwave Listeners. Work was in progress on the Sackville development project, which provides for the eventual installation of five new 250-kw. transmitters. Recorded and taped programs of Canadian music, documentaries and drama were distributed to radio organizations in more than 130 countries. About 49,000 program hours of music were distributed by the transcription department of the IS and some of these recordings were also released on the commercial market in co-operation with various recording companies.

Sales of CBC programs to other countries included drama and ballet productions to NET television in the United States; programs from the radio series "The Art of Glenn Gould" to stations of the Educational Radio Network in the United States and to New Zealand; popular drama and science series to television networks in Holland and Sweden; a number of music and drama programs to Britain, and the historical drama series "D'Iberville" to various French-speaking countries. "Cinderella", a 1968 CBC television production with the National Ballet of Canada, won a United States Emmy Award as the best classical music program of the year after its 1970 showing on the National Educational Television network in the United States.

During 1969 and 1970, the CBC was represented at the annual meeting of the Asian Broadcasting Union, was host for meetings of the Communauté des télévisions francophones and the Communauté radiophonique des programmes de langue française, and participated in the 8th Commonwealth Broadcasting Conference held in Jamaica. Radio and television co-productions were arranged with several foreign broadcasters in the areas of children's programming, variety, music, opera, drama and documentary. A number of training attachments with the CBC, some of them in co-operation with the Canadian International Development Agency, were arranged for foreign broadcasting students.

The CBC acted as broadcasting consultant to the Canadian delegation attending a UNESCO world meeting on satellite broadcasting in 1969, and continued to contribute to the joint studies on satellites being prepared for the United Nations by Canada and Sweden. CBC liaison continued with other broadcasting organizations engaged in satellite broadcasting projects.

Finance.—Total operating expense for the year ended Mar. 31, 1970 was \$208,033,000, an increase of \$11,500,000 or 5.9 p.c. over the previous year; this amount included \$10,182,000 for depreciation and amortization not recoverable from the Parliamentary payment. An amount of \$18,909,000 was obtained from revenue (mostly advertising revenue which grossed \$47,033,000), a significant increase over the previous year. Of the total Parliamentary payment of \$166,000,000, an amount of \$148,942,000 was applied to meet net operating expenditures, and \$5,065,000 was applied to repayment of capital loans; the surplus of \$11,993,000 was carried forward to meet future operating expenditures. Capital assets, after accumulated depreciation, totalled \$115,000,000.

As a Crown corporation, the CBC was affected by Government budget restraints during 1969 and 1970. The Parliamentary payment for operating the national broadcasting service in 1970-71 was frozen at the 1969-70 level, leaving commercial revenue as the CBC's only means of increasing its income to meet rising costs and provide for additional

Canadian production. The problem was partly eased when the Government agreed to a wording in the Appropriation Act for 1969-70 which made it possible for the Corporation to carry over into 1970-71, as a reserve, the \$12,000,000 it was able to save in 1969-70.

Statistics of the Broadcasting Industry*

Financial and other statistics of the radio and television broadcasting industry are obtained by the Dominion Bureau of Statistics in co-operation with the Canadian Radio-Television Commission; summary figures for private and CBC sectors are given in Table 9 for the year 1969.

In 1969, 329 private radio stations and 67 television stations reported to DBS. The operating revenue of the broadcasting industry for the year amounted to \$252,506,891, an increase of 12.0 p.c. over 1968. Of the total, radio broadcasting accounted for \$110,066,435 or 43.6 p.c. and television broadcasting for \$142,440,456 or 56.4 p.c.; in 1968, radio received \$97,543,936 or 43.2 p.c. and television \$127,987,695 or 56.8 p.c. Revenue from national and network time sales represented 61.4 p.c. of the total broadcasting revenue and revenue from local time sales 38.6 p.c.; national and network time sales increased by 11.1 p.c., local time sales by 15.5 p.c. and other incidental operating revenue by 1.0 p.c. over 1968. Operating expenses in 1969 at \$381,953,728 were 11.9 p.c. higher than in 1968. The growth of revenues exceeded the growth of expenses and resulted in an operating profit of \$36,623,163 in 1969 compared with one of \$29,901,202 in 1968. After adjustment on account of other income and expenses and income taxes, the final net profit of the private sector of the broadcasting industry in 1969 was \$17,744,962 compared with \$17,107,000 in 1968.

³ The CBC charges its operations with depreciation. The charge so made has been added to the Parliamentary grants.

Statistics of the Community Antenna Industry.—In 1967, for the first time, the Dominion Bureau of Statistics published statistics on the CATV industry in Canada, summary results of which are given in Table 10. The industry registered an increase in revenue in 1969 over 1968 of 19.5 p.c. from \$31,285,513 to \$37,379,909. Of the 1969 total, revenue from monthly service charges accounted for \$33,440,283 or 89.5 p.c. A \$4,844,252 increase in operating expenses in the later year was attributable mainly to an increase of \$2,178,136 for salaries, wages and bonuses. However, operating revenue exceeded expenses, resulting in an operating profit of \$6,101,492 as compared with a profit of \$4,851,348 in 1968.

Section 3.—The National Film Board*

The National Film Board, an agency of the Federal Government, was established by Act of Parliament in 1939 and reconstituted by the National Film Act in 1950—its function, “to initiate and promote the production and distribution of films in the national interest”. The Board’s films are produced in Canada’s two official languages and, during the thirty years of production, have made a considerable contribution to the country’s culture and to the national identity.

* Statistics relating to the over-all motion picture industry in Canada are given in Chapter XXI, pp. 1019-1021.

In addition to 35mm and 16mm films, the Board produces and distributes other visual aids materials—filmstrips, 8mm loop films, slide sets, overhead projectuals, multi-media kits and photo stories.

The growing sophistication of film audiences and the increasing importance of film as a means of communication are reflected in the nature of films produced—features, documentaries, informational films, films for the specific needs of government departments, and films designed for particular social purposes. The Board strives to serve as innovator of new cinema techniques, as well as a recorder of the nation's day-to-day evolution. Thus, new needs and greater public sensitivity have encouraged the Board's film-makers to explore new filmic styles and to experiment in new areas of film production. There have been corresponding new departures in the distribution and use of films, as more people turn to films as a matter of course for information and assistance in many activities.

In Canada, the Board's productions are distributed through community outlets, schools and universities, television stations, theatres and commercial sales. In all of these areas annual figures show a steady, in some instances a marked, increase. A large part of the 16mm community film audience is reached through film libraries, film councils and special interest groups. The growing appetite for films can be attributed to the wide range of subject matter available. The Board's catalogue, produced by its Publicity Division, lists some sixty main and sub-categories. Original films are shown regularly over English-language and French-language television networks in Canada as well as in cinemas, mainly through the Columbia Pictures chain.

Distribution outside Canada has also continued to increase. Films abroad may be obtained through the Board's offices in London, Paris, New Delhi, Tokyo, Buenos Aires, New York, and from posts of the Departments of External Affairs and of Industry, Trade and Commerce. Recent figures show a total world audience exceeding 60,000,000 from the latter sources alone, and exhibition in cinemas in over 100 countries. Films are versioned in more than 40 languages to increase their usefulness in foreign countries. Part of the Board's external distribution program is in support of Canada's tourist industry and to this end it distributes, particularly in the United States, films produced by provincial governments and companies engaged in the travel industry.

The Board, in its mandate to "interpret Canada to Canadians and to the rest of the world", seeks to reflect the interests of the Canadian people and those shared with other people around the world. That demand for the Board's films grows by about 33 p.c. a year would indicate that this mandate is being fulfilled.

Section 4.—Postal Service

The basic tasks of the Canadian Postal Service are to receive, convey and deliver postal matter with speed and security, for which duties it maintains thousands of post offices and utilizes air, rail, road and water transportation facilities. Associated functions include the sale of stamps and other articles of postage, the registration of letters and other mail for dispatch, the insuring of parcels, the accounting of COD articles and the transaction of money-order business. Also, because of its transcontinental facilities, the Post Office assists other government departments with such tasks as selling unemployment insurance stamps and hunting permits, collecting government annuity payments, distributing income tax forms and Public Service employment application forms, and displaying government posters.

Post offices are established wherever the population warrants. Those in rural areas and small urban centres transact all the functions of a city office. In larger urban areas, postal stations have full functions similar to the main post office, including general delivery service, lock-box delivery and letter-carrier delivery. Much sophisticated automatic equipment has been installed in Canada's larger post offices, which could be described as

complex semi-automated plants. Such devices include conveyors and chutes, parcel and bag sorting machines, photo-electric counters, intercom systems, observation gallery telephone systems and industrial music. Outside the post office building, mailmobiles, automatic stamp-vending machines and curbside mail boxes are in use.

The operating service of the Post Office Department is organized into four regions, each headed by a General Manager reporting directly to the Deputy Postmaster General. The regions are further divided into districts, each headed by a District Director. The operating and support functions required in the provision of postal service to the public are the responsibility of the local postmasters who receive technical and administrative assistance from district and regional offices at strategic points.

Postal service is provided in Canada from Newfoundland to the west coast of Vancouver Island and from Pelee Island, Ont., in the south, to settlements and missions far into the Arctic. Canada's airmail system utilizes most transcontinental flights, supported by many branch and connecting lines, and links up with the United States domestic and other international airmail systems. First class domestic mail is carried by air between Canadian points, whenever delivery can thus be expedited. Air stage routes provide an all-class mail service to many northern areas which can only be served by air. There are over 46,000 miles of airmail and air stage routes.

At Mar. 31, 1970, there were 9,575 post offices in operation; letter-carrier delivery was being provided in 245 urban areas and 5,220 private contractors were delivering mail to 731,544 rural and suburban households. In 1970, there were 644 city mail services transporting mail between post offices and postal stations, collecting mail from street letter boxes and delivering parcel post, and some 441 side services were transporting mail between post offices and railway stations, wharves and airports. Intercity transportation of mail by highway motor vehicles was being conducted by 626 major services, complemented by 1,117 feeder or stage services operating to and from smaller centres. Although many of the highway services have replaced rail for the transportation of mails, rail remained the principal mode for long-distance movements of other than first-class matter.

Revenue and expenditure of the Post Office Department for the five years ended Mar. 31, 1970 are shown in Table 11; gross revenue receipts are received mainly from postage, either in the form of postage stamps and stamped stationery, or postage meter and postage register machine impressions. Some postage is also paid in cash without stamps, stamped stationery or meter and register impressions.

11.—Revenue and Expenditure of the Post Office Department, Years Ended Mar. 31, 1966-70

Year Ended Mar. 31—	Revenue	Expenditure	Deficit
	\$	\$	\$
1966:.....	285,100,000	315,800,000	30,700,000
1967:.....	305,400,000	353,100,000	47,700,000
1968:.....	337,023,000	404,214,000	67,191,000
1969:.....	374,902,000	465,233,000	90,331,000
1970:.....	444,069,000	497,017,000	52,948,000

In the year ended Mar. 31, 1970, post office money orders, issued for any amount not exceeding \$100 and payable in almost any country of the world, were sold at 9,078 post offices and money orders payable in Canada only, for amounts not exceeding \$15.99, were

sold at some 427 additional post offices. During the year, 50,656,428 money orders were issued having a value of \$1,005,774,964, of which \$978,491,340 was payable in Canada and \$27,283,624 was payable in other countries. The value of money orders issued in other countries and payable in Canada was \$8,234,306.

Section 5.—The Press*

The freedom of the public in Canada is strenuously exercised by an omnipresent press. Daily newspapers published in the country in 1970 numbered 120, counting morning and evening editions separately. Combined circulation was about 4,572,000—84 p.c. in English and 16 p.c. in French. Publishers' surveys show that each newspaper is read by an average of three persons.

Daily newspaper advertising revenue in 1968 was \$260,072,060 and circulation revenue was \$97,259,000. By comparison, advertising revenue of 319 private radio stations in Canada in 1968 was \$93,389,000 and of 68 private television stations \$88,566,000. In 1970, there were 14 daily newspapers with circulation in excess of 100,000, accounting for about 56 p.c. of total circulation. There were 12 dailies published in the French language, 10 of them located in Quebec. Although the circulation of daily newspapers blankets the more populous areas well beyond publishing points, smaller cities and towns and rural areas are also served by 818 weekly newspapers catering to local interests and exercising important local influence. The Canadian society is also enriched by 89 ethnic daily or weekly newspapers published in many languages, often sprinkled with English.

About 60 p.c. of Canada's daily newspapers are privately owned or independent. There are three major newspaper chains in the country, owned by Southam Press Ltd. (10 dailies), Thomson Newspapers Ltd. (27 dailies) and FP Publications Ltd. (eight dailies). Both Southam and Thomson Newspapers are publicly owned companies with shares traded on Canadian stock exchanges. Papers in the Thomson chain are concentrated in the smaller cities. FP accounts for about 19 p.c. of total daily circulation, Southam for 18 p.c. and Thomson for about 8 p.c.

In addition to their own news-gathering staffs and facilities, Canadian newspapers subscribe to a number of syndicated agencies and wire services, the largest being The Canadian Press which is a co-operative agency owned and operated by Canadian dailies. Largely by teletype and wirephoto transmission, it provides its 102 member newspapers with world and Canadian news and also serves weekly newspapers and radio and television stations. CP has its own news-gathering staff and each member newspaper provides the agency with important local news for transmission to fellow members and members share the cost in ratio to their circulations.

CP carries world news from Reuters (the British agency), from Associated Press (the United States co-operative) and from Agence France-Presse (of France) and these agencies are offered CP news on a reciprocal basis. CP maintains a French-language service in Quebec.

United Press International of Canada, the second major news wire service in Canada, is a private company and a part of United Press International World Service. It provides Canadian and international news and pictures to about 40 subscribers in Canada and is an outlet for Canadian news through United Press International facilities throughout the world. Certain foreign newspapers maintain bureaus in Ottawa and elsewhere in Canada to collect and interpret Canadian news.

* An article in the 1957-58 Year Book traces developments in Canadian journalism from their beginnings in 1752 to (circa) 1900. A second article appearing in the 1959 edition brings that account up to 1958.

Press Statistics.—The following tables are based on data estimated from *Canadian Advertising*. Circulation figures are given for daily English-language and French-language newspapers only. Such circulation figures are relatively easy to obtain because, in their own interest, newspapers qualify for and subscribe to the Audit Bureau of Circulation. For these, ABC 'net paid' figures have been used; 'controlled' (free) distribution newspapers are not included. On the other hand, circulation data for foreign-language newspapers, weekly newspapers, weekend newspapers and magazines are incomplete and therefore not usable.

Revenue from Printing and Publishing.—One of the industrial groups for which information is collected by the DBS in its annual Census of Manufactures is the printing, publishing and allied industries group which includes establishments engaged primarily in the publishing and printing of newspapers, magazines, periodicals, books, almanacs, maps, guides and the like, as well as establishments printing such publications for publishers, publishing firms that do no printing, and engraving, stereotyping and allied industries. Of interest in connection with press statistics is the amount of revenue received by these industries from advertising and from subscriptions or sales, which is given for the years 1967 and 1968 in Table 16. Additional data on manufacturing activity of this industrial group are included in Chapter XVI on Manufactures.

PART I.—THE MOVEMENT AND MARKETING OF COMMODITIES

Domestic trade is broad in terms of scope, complex in terms of activity, and volatile in the forms it takes. It encompasses all values added to commodities by agencies and services connected with the warehousing, distribution and sale of goods within each province as well as between provinces. Domestic trade is engaged in or facilitated by manufacturers, wholesale and retail establishments, mail-order houses, service trades, warehouse operators and other distributors, and by such "outside" agencies as banks, insurance companies, railway and trucking companies, advertising agencies and market research houses.

In recent years, a considerable degree of interest and speculation has been focused on the service trades, which embrace a wide spectrum of activities engaged in by professional, business and personal service establishments. Included also are the amusement and recreation services, which include regular and drive-in movie theatres, bowling alleys, health clubs, golf courses, race tracks and other sports activities, and the fast-growing accommodation and food service fields, comprising hotels, motels, tourist facilities, restaurants and drive-in "fast food" outlets.

The degree of interest being shown in the services field is further indicated by the number of trades to be surveyed for the first time in the 1971 Census. These include, in the amusement and recreation services group, marinas, ski facility operators, driving ranges and miniature golf courses; and, in the business services group, computer services, media representatives, architects, professional engineers and other engineering and scientific services, lawyers and notaries, and management and business consultants. However, services provided by doctors, dentists, nurses, hospitals and educational institutions remain outside the scope of the Census of Merchandising and Services.

Only certain phases of the broad and ever-widening field of domestic trade (mainly the retail, wholesale and service trades) are covered in this Chapter but, wherever possible, references are given to related material appearing elsewhere in this publication. The arrangement of material in a volume such as the Year Book is governed by the necessity of interpretation from various perspectives. The Index will be found useful in this respect.

Section 1.—Merchandising and Service Establishments*

Data on merchandising and service establishments are derived principally from a periodic census (or full-coverage survey) of such business establishments. The first census was taken in 1931, followed by similar censuses in 1941, 1951 and 1961. The reports for 1961, which provided a wider range of data than any previous census, contained information on sales, inventory and credit; gross margins and operating expenses; small geographic area data; and, for "establishments" only (definition below), an analysis of sales by commodities.

The 1961 Census marked the end of the decennial census program. Commencing with 1966, the censuses of merchandising and service establishments became part of a quinquennial series in order to provide more frequent survey benchmarks and to enable publication of more up-to-date statistics than was previously possible. Subsection 1 gives summary results of the 1966 Census, covering retail and service trades.

Each census, as it is completed, forms a new base for the various intercensal (monthly, quarterly and annual) surveys of retail, wholesale and service trades; some are sample surveys and others are carried out on a full-coverage basis. Subsection 2 contains current intercensal information obtained as a result of these surveys, relative not only to the distributive trades but to other statistical series (i.e., consumer credit) as well. It should be noted that most of these data have now been converted from a 1961 to a 1966 base. Where revisions have not yet been completed, the data may be secured, as they are compiled, from the Merchandising and Services Division.

Subsection 1.—1966 Census of Merchandising and Services

Retail Trade†

The results of the 1966 retail trade census, particularly in the smaller geographic areas, reflect the changes—both institutional and definitional—that took place between 1961 and 1966 in the structure of retailing. The advent of new shopping areas, whether in the form of planned multi-purpose establishments or as single, highly diversified stores, had a significant effect on retail trade. So, too, did urban redevelopment and the construction of new retail outlets outside the corporate boundaries of cities and towns.‡

Although no classification changes were made during the 1961-66 period which could have altered the scope of retailing, there were a number of definitional changes *within* the retail universe that affected the comparability of certain statistical series (see Table 1) in 1966. In addition, two new classifications were created, further complicating the problem of direct comparison with earlier data. Details of the changes are as follows:—

1. In order to more accurately describe the realignment of activities that had taken place within retail food stores during the mid-1960s, a new classification of "grocery, confec-

* Prepared in the Merchandising and Services Division, Dominion Bureau of Statistics.

† 1966 *Census of Canada*, Vol. VI, *Retail Trade* (location series, Catalogue Nos. 97-602 to 97-606; establishment series, Catalogue Nos. 97-607 and 97-608). For the purpose of the census, a *location* is defined as "a recognizable place of business in which the principal activity is the display and sale of goods to the general public for personal or household consumption". In other words, the location series provides aggregate data on the physical locations in which retailing activities actually take place. The *establishment*, on the other hand, is "the smallest unit which is a separate operating entity capable of reporting those elements of input and output necessary to the calculation of gross margin, as well as employment, wages and salaries". The location is *not* dependent on the system of accounting; the establishment is.

‡ For purposes of analysis and research, the reader is referred to *DBS Market Research Handbook*, 1969 ed. (Catalogue No. 63-514), published by the Merchandising and Services Division. This volume contains detailed information, particularly for small geographic areas, on population, housing, income, agriculture, manufacturing, and the retail and service trades.

tionery and sundries stores" was introduced. This classification largely replaced the old "confectionery stores" category (the remainder of which was then combined with "candy and nut stores") and encompassed as well an unknown number of stores formerly classified as "grocery stores, without fresh meat". Although this change affected the internal distribution of "food stores", the group as a whole remains comparable with the 1961 results.

2. A major change in definition occurred in the department store category, details of which may be found in *1966 Census of Canada*, Vol. VI, "Retail Trade: Introduction and General Review", Catalogue No. 97-601. Briefly, the data now reflect a "pure" department store concept, both at the *location* and *establishment* levels. All non-department store activities, including mail order and catalogue sales offices, have been reclassified to more appropriate kinds of business, i.e., general merchandise stores, women's clothing stores, etc. An important change in treatment was accorded the sales of concessions located in department store outlets. Prior to 1966, concessions were tabulated and counted as separate "stores" in their own kind of business; as a result of the new definition, however, sales of concessions were generally included in the *total business of department stores in which they were situated*. These changes make direct comparison with related trade results in 1961 either difficult or impossible.
3. Another new census classification introduced in 1966 was "home and auto supply stores", in which no one commodity group can account for more than 50 p.c. of total sales. These stores can be added to the more specialized classification from which they stemmed, "accessories, tire and battery stores", in order to achieve comparability with 1961.

Table 1 shows the growth in retail trade from 1961 to 1966, stratified by kind-of-business groups (used in intercensal surveys) and giving a comparison of 1966 data (1) when calculated using 1961 definitions, (2) as published, and (3) with post-censal corrections included. Table 2 gives summary data on retail trade by kind of business in 1966; figures for urban centres of 30,000 population or over are published in *DBS Bulletin 1966 Census of Canada, Retail Trade*, (Catalogue No. 97-602).

The establishment series, as noted earlier, is based upon record-keeping and the capability at the reporting unit to provide certain minimum types of information not normally available at the location level. Because it is based on the accounting entity rather than on the existence of a certain number of physical retailing locations, the establishment series is related to other series within DBS and can be utilized as part of the system of national accounting. Table 3 provides information on sales of retail establishments by class of customer for kind-of-business groups and selected trades.

Service Trades*

Changes within the service sector of the economy can best be measured and analysed by comparing the results obtained in each census of merchandising and services because, at present, intercensal surveys provide only partial coverage of this large and diversified field. Consumer expenditures on services—at least, those considered within the scope of the census—have increased rapidly in recent years. Examination of the 1961-66 rates of change within the following key economic areas shows that the service trades have developed at a faster rate than most other important indicators:—

<i>Indicator</i>	<i>Rate of Change 1961-66</i>
	p.c.
Gross national product.....	+ 57.2
Personal income.....	+ 55.4
Service trades (location series).....	+ 53.9
Personal disposable income.....	+ 50.7
Personal consumer expenditure.....	+ 43.5
Per capita personal income.....	+ 41.6
Retail trade (location series).....	+ 41.1
Per capita personal disposable income.....	+ 37.3
Per capita personal consumer expenditure.....	+ 30.8

At their present rate of growth, the receipts of service trades covered by the census will have more than doubled in the period 1961-71. The areas showing the greatest potential for growth during this decade (Table 4) include services of business management, amusement and recreation services, and the hotel and restaurant group.

* 1966 Census of Canada, Vol. VIII, "Service Trades" (location series, Catalogue Nos. 97-642 to 97-645; establishment series, Catalogue No. 97-647). For explanation of the terms "location" and "establishment", see footnote † p. 997.

Subsection 2.—Intercensal Surveys of Retail, Wholesale and Service Trades

Retail Trade

The trend of retail trade is one of the most accurate barometers of the economic health and well-being of the nation. In 1969, retailers accounted for 54.2 p.c. of personal disposable income available to Canadians and 58.8 p.c. of total personal expenditure on consumer goods and services. The value of retail sales, estimated from intercensal sample surveys (and revised every five years to a new census base*), increased by 20.4 p.c. during the period 1966-69.

The current retail trade series shown in Table 5 reflects the many definitional changes adopted for use in the 1966 Census. The new classification, "grocery, confectionery and sundries stores", is included in the "grocery and combination stores" series; on the other hand, "home and auto supply stores" and "accessories, tire and battery stores" remain part of the "all other stores" category. In addition, as described earlier, the department store definition was changed and this affected the variety store and general store series. Also, a new kind of business—general merchandise stores—was taken out of the miscellaneous stores grouping and established as a separate series, commencing in 1966.

* Details of intercensal revisions may be found in *Retail Trade, Intercensal Revisions, 1961-66* (Catalogue No. 63-517—Part 1) and in *Retail Trade, Post-censal Revisions, 1966-69* (Catalogue No. 63-517—Part 2).

Chain* and Independent Stores.—Within the framework of retail trade, chains and independent retailers compete to achieve or retain a viable share of the total market. In some kinds of business, such as motor vehicle dealers, service stations and garages, food stores other than grocery and combination stores, and men's clothing stores, independent merchants have maintained a dominant position; in others, such as department stores, variety stores and general merchandise stores, chains account for the largest proportion of sales. In recent years, changes in market share have been most pronounced among women's clothing stores, grocery and combination stores, hardware stores, general merchandise stores, and family clothing stores. The constantly shifting balance between chain and independent stores is shown in Tables 6 and 7.

* A retail chain is defined by DBS as "an organization operating four or more retail stores in the same kind of business under the same legal ownership". A concession located in a department store is *not* considered to be a store location for the purpose of this definition.

Department Stores.—In 1969, department stores accounted for a higher proportion of total sales than most other kinds of retail businesses—exceeded only by grocery and combination stores and motor vehicle dealers. Their sales of \$2,723,200,000 represented nearly 10 p.c. of total retail trade and 13.2 p.c. of the business done by competing firms (all trades other than motor vehicle dealers, fuel dealers and parts of the "all other stores" classification). Department store sales in 1969 were 38.0 p.c. higher than in 1966, the

largest increase among the 18 specified kinds of business (see Table 5). However, growth among the various departments within department stores has not been consistent, as Table 8 shows.

¹ Based on extrapolations of original published data.

Voluntary Group Stores.—In order to stem the continuing encroachment of chains and department stores on their share of the market, independent retailers have turned increasingly in recent years to affiliation with a voluntary group organization. Through such group affiliation, independent businessmen were afforded the opportunity to enjoy many, if not all, of the benefits accruing to chain store firms—mass purchasing power, centralized buying, lower per-unit advertising costs and a number of important management services. As sponsors and/or suppliers of many voluntary groups, wholesalers also benefited, particularly through the streamlining of their selling and order-filling systems.

The effects of voluntary group participation on the sales of retail store owners during the 1967-68 period are shown in Table 9. For a number of reasons, affiliated retailers

met with widely varying degrees of success (as measured by sales comparisons with non-affiliated independent and chain store organizations) in the course of these years. Although independent variety stores in voluntary groups registered a decline of 3.3 p.c. in sales, the over-all experience of affiliated stores—both chain and independent—was far better than the results recorded by their non-affiliated competitors. In three of the four specified trades, non-affiliated independent stores showed the largest drop in sales and, in two of the four trades, affiliated independent stores showed the largest rise. The most dramatic changes occurred in the affiliated chain store sector, where sales increased at a faster rate than in any previous period—particularly in the drug and hardware kinds of business.

9.—Retail Sales in Affiliated and Non-affiliated Stores, 1967 and 1968

New Motor Vehicle Sales.—The largest homogeneous group of commodities sold within the confines of retail outlets is embodied in the classification "new motor vehicles". In the only current* survey of retail trade carried on at the commodity level (all others are based on "kind of business"), new motor vehicles are taken to include private passenger cars and taxis, trucks, buses, and other commercial vehicles sold at retail. As shown in Table 10, sales of new motor vehicles in 1969 reached a new high of \$3,322,879,000, based on the actual cost to purchasers (prior to 1967, the data were based on manufacturers' suggested list prices).

* DBS also produces—on an occasional basis (at present, once every five years)—a comprehensive report on all commodities sold in retail outlets. The most recent publication, *Retail Commodity Sales, 1968* (Catalogue No. 63-518), was released in February 1971.

10.—Retail Sales of New Motor Vehicles, 1960-69

In recent years, the sales of overseas-manufactured vehicles—both passenger cars and trucks—have been increasing at a faster rate than those of Canadian and United States manufacture. In addition, the share of the new motor vehicle market held by overseas manufacturers has been rising apace; 1969 marked the third consecutive year of growth in the market share of new overseas vehicles. Table 11 shows new motor vehicle sales, by type of vehicle and by source of origin, for 1968 and 1969. It will be noted that one out of every seven new vehicles sold during 1969 was an overseas-built model, and that nearly one tenth of Canadian sales dollars went toward the purchase of such models.

Direct Selling.—Consumer goods, in addition to being sold in retail stores, often reach the household user through other more direct channels of distribution—commonly described as “direct selling”. These channels are characterized by the fact that the commodities handled bypass the retail outlet completely in moving from manufacturer to distributor to household consumer. The DBS periodically carries out surveys of two distinct forms of direct selling: merchandise sales of vending machine operators, and of manufacturers* and distributors specializing in direct-sales methods.

Vending Machine Operators.—This survey is designed to measure the value of sales made through automatic vending machines owned or operated by vending machine firms, including soft drink bottlers engaged in vending activities on a regular year-round basis. In 1969, such sales reached a new high of \$142,909,600, 12.5 p.c. above the 1968 total of \$127,058,600. Although exact information on the number of vending machines and ancillary equipment used during 1969 is not available, the sample survey of that year indicated a possible total of 97,500 vending machines in operation—1,633 more than in 1968. It may be of some interest to note that there were 981 microwave and infra-red ovens, as

* See Manufactures Chapter, Sect. 2, pp. 794-799.

well as 1,843 coin and bill changers, in use during 1968; if these numbers remained constant between 1968 and 1969, the total of all machines in 1969 would have exceeded, for the first time, the 100,000 mark.

12.—Vending Machine Operators, 1960-69

sample survey for 1969.

² Not available; see text above re

Although vending machines can be used to distribute many types of commodities, the largest proportion of sales has been accounted for consistently by three main lines: tobacco products; hot drinks; and cold drinks vended in bottles, cans, cartons and disposable cups. In 1969, sales in these three product areas amounted to \$114,049,200, an increase of 10.6 p.c. over the 1968 total. However, the over-all importance of tobacco products, hot drinks and cold drinks is declining. In 1960, these commodities accounted for 87.4 p.c. of all merchandise sold in vending machines; by 1969, this proportion had fallen to 79.8 p.c. Among commodities sold in vending machines, canned hot foods and canned soups, fresh foods and pastries showed the largest increases in market share during 1968-69.

13.—Value and Percentage Distribution of Sales by Vending Machine Operators, by Product, 1968 and 1969

Direct Selling by Manufacturers and Specialist Agencies.—The first annual survey of direct selling, covering manufacturers and selected agencies specializing in direct-sales methods, was taken in 1966. Table 14 shows that, over the four-year period 1966-69, such direct sales increased by more than 15 p.c., rising from \$617,089,000 to \$712,088,000. Among the industries surveyed, the largest share of sales was accounted for by manufacturers and distributors of dairy products (23.6 p.c.); newspapers and magazines (18.0 p.c.); cosmetics (9.5 p.c.); books (8.2 p.c.); bakery products (7.2 p.c.); and electrical appliances

(7.0 p.c.)—nearly three quarters of all direct sales covered. The greatest growth, however, occurred primarily in other areas: direct sales of kitchenware and appliances rose 62.4 p.c.; clothing, 55.4 p.c.; nursery seeds, stock and fertilizer, 42.9 p.c.; and cosmetics, 34.4 p.c.

The channels of distribution employed by direct sellers in 1969 were very similar to those utilized in earlier years. As shown in Table 15, door-to-door sales in that year accounted for 72 p.c. of total sales, mail-order requests (excluding the mail-order business of Canadian department stores) amounted to 19 p.c., and sales from manufacturers' premises were 6 p.c.; the remaining 3 p.c. was sold by various other methods of contacting the customer.

Campus Book Stores.—As a supplement to its current retail trade series, the DBS has recently initiated a survey of book stores located on the campuses of universities and other post-secondary educational institutions. The pilot study was undertaken in the Spring of 1969, covering the academic years 1966-67 and 1967-68, and a subsequent survey produced a full range of data relating to the 1968-69 year. Table 16 provides summary data on the sales of campus book stores for the three years.

³ In-

Wholesale Trade

The sales of wholesale merchants,* as estimated in the course of a monthly sample survey of such establishments, have increased consistently over the past several years. In 1969, they reached a new high of \$18,046,000,000, nearly 6 p.c. above the \$17,038,000,000 recorded during 1968. Consumer goods wholesalers experienced a 6.9-p.c. increase in sales, compared with a 5.1-p.c. rise for wholesalers of industrial goods. Only in the latter category were there declines in any specific trades; the sales of coal and coke, grain and farm machinery wholesalers were all lower in 1969 than in the previous year.

Table 17 shows the annual sales of wholesale merchants in 26 kind-of-business groupings during the period 1965-69. These data reflect changes in the wholesale trade series brought about by revisions to a 1964 benchmark, updating the figures from the previous (1961) base. The intercensal revisions, parts of which are included here, were published in a special report released by DBS in April 1969 entitled *Wholesale Trade, 1951-1968* (Catalogue No. 63-515).

* Excludes manufacturers' sales branches, agents and brokers, primary product dealers, and petroleum bulk plants and distributors; see *Wholesale Trade*, December 1969 (Catalogue No. 63-008).

In addition to the major monthly survey of wholesale merchants, two annual surveys of wholesale sales at the commodity level are also undertaken by DBS—farm implements and equipment, and construction machinery and equipment. It should be noted that estimates of farm implement and equipment sales are also published monthly, in aggregate form, based on the data reported by a panel of major-line companies.

Farm Implements and Equipment.—Sales of farm implements and equipment (valued at wholesale prices) declined in 1969 for the second consecutive year. The sales total of \$344,309,000 was 8.9 p.c. lower than the comparable 1968 figure of \$378,131,000. However, sales declines were limited to the three Prairie Provinces of Manitoba (−21.9 p.c.), Saskatchewan (−25.7 p.c.) and Alberta (−11.0 p.c.). Saskatchewan, which formerly accounted for the largest share of farm implements and equipment sales (in 1969, it was Ontario), experienced the greatest decline for the third consecutive year. Table 18 gives data on sales for 1965-69; sales of repair parts, not shown, were \$65,751,000 in 1969, 2.8 p.c. higher than the record \$63,955,000 reached in the previous year.

18.—Sales of Farm Implements and Equipment, by Province and by Major Group, 1965-69

NOTE.—Data are based on a commodity survey and therefore exclude sales of other products and receipts from secondary activities, including repairs, carried out by respondents. The figures are not comparable with those given in Table 17.

Construction Machinery and Equipment.—This survey, which was first undertaken for the year 1967 and since repeated for 1969, was designed to measure the sales of Canadian distributors and direct sales of manufacturers to end-users in the construction machinery and equipment field and to assess the revenue derived from rentals. As shown in Table 19, total sales and rental revenue amounted to \$705,724,000, almost 80 p.c. of which was realized through the sale of new machinery and equipment. The 1969 survey for the first time produced additional information on the disposal of new construction machinery and equipment to end-users through such arrangements as first rental, demonstration or loan; the value of such machinery and equipment reached \$52,366,509 in 1969.

Service Trades

Hotels.—In addition to its annual hotel survey (Catalogue No. 63-204), DBS also reports semi-annually on the trend of hotel receipts in Canada, based on results obtained from a panel of hotels having 50 or more rooms. Table 20 shows that the receipts of such hotels increased by more than 31 p.c. during the 1965-69 period. The best results were experienced in British Columbia and Alberta, and the poorest in Newfoundland and Prince Edward Island (combined) and in Saskatchewan. On a year-to-year basis, the greatest rise took place between 1966 and 1967, as Canada's Centennial-year celebrations produced a significant volume of hotel business. The let-down from 1967 to 1968 was most acutely felt in Quebec, which had shown the greatest increase in the previous year. From 1968 to 1969, hotel receipts in most provinces (except New Brunswick and Saskatchewan) increased at a faster rate than in the previous year. Alberta and Quebec, in particular, registered sizable increases during 1969. In contrast, hotel receipts in Saskatchewan have been trending downward, with successively smaller rates of growth each year from 1966 onward.

20.—Percentage Change in Hotel Receipts, by Province, 1965-69

¹ Includes the Yukon and Northwest Territories.

Restaurants.—The same forces that shaped hotel business during recent years were also evident in another large area of the service trades—restaurants and other eating places. It was these forces that produced the largest year-over-year increase in Quebec between 1966 and 1967, and that resulted in the largest decline in the same province between 1967 and 1968. As indicated in Table 21, restaurant receipts rose by more than \$200,000,000 (20.0 p.c.) over the 1965-69 period. The largest percentage growth took place in Alberta (43.2 p.c.) and British Columbia (34.1 p.c.) and the smallest in Newfoundland and Saskatchewan. An absolute decline was recorded in only one province—Saskatchewan.

Motion Picture Theatres.—In 1968,* the receipts of motion picture theatres, both regular and drive-in, reached their highest level in the past 14 years—and the highest level ever for drive-ins alone. The total of \$113,697,252 received was 9.8 p.c. higher than in 1967 and the amount of amusement taxes collected rose to \$8,199,630, up 13.6 p.c. over the previous year. The increase in revenues was not evenly split; drive-in theatre receipts grew at a somewhat faster rate (+14.9 p.c.) than those of regular motion picture theatres (+9.1 p.c.). In contrast to the revenue and tax increases, the number of admissions for all types of theatres declined in 1968 for the fourth successive year, dropping 0.4 p.c. to 97,188,785. As in previous years, the decline in admissions was restricted to regular theatres, which lost nearly 600,000 customers between 1967 and 1968.

* Latest data available at time of writing.

Film Exchanges.—During 1968,* films were distributed by 56 companies through 120 offices located across Canada. These exchanges had total receipts of \$64,653,218 compared with \$56,551,239 in 1967 and paid \$4,733,799 in salaries and wages to 761 employees. (The activities of the National Film Board of Canada are not included here; they are covered in the Board's Annual Report, available from Information Canada, Ottawa.)

Receipts from the rental of films increased by \$8,087,642 (14.4 p.c.) during 1968 to reach a new high of \$64,186,740. Revenue derived from rentals for theatrical use amounted to \$43,624,234, for television use \$19,682,511 and for other (non-theatrical) use \$879,995. In addition, \$25,893 was derived from the sale of advertising and \$440,585 from other sources. New films released for theatrical bookings numbered 1,047, of which 649 were feature films, 114 cartoons, 166 newsreels and 118 other short subjects. Of the 649 feature films, 314 originated in the United States, 121 in France, 80 in Italy, 52 in Britain, eight in Canada and 74 in other countries.

Motion Picture Production.—In 1969, there were 89 private (non-government) firms engaged principally in the production and printing of motion picture films and filmstrips for industry, government, education and entertainment purposes. These firms employed 1,127 persons, paid \$7,680,062 in salaries and wages, and had a gross revenue of \$26,864,914, slightly lower than in 1968. Excluded from these data are television stations and two private firms engaged only partially in motion picture production; the latter produced 21 commercial advertising films, all for television use.

* Latest data available at time of writing.

Table 25 shows the motion picture production records of both private industry and government agencies during 1968 and 1969. Of the 5,515 films produced in Canada in 1969, 5,429 were in the English or French languages. During that year, Canadian motion picture production fell significantly below the 1968 level of activity; production by private firms declined 31.7 p.c. and by government agencies, 13.6 p.c. In total, private and government film producers printed 4,005,200 ft. of 8mm film, 49,320,793 ft. of 16mm film and 4,006,987 ft. of 35 mm film in black and white; and 1,201,925 ft. of 8mm film, 47,389,572 ft. of 16mm film and 9,702,797 ft. of 35mm film in colour. Included in these figures were 13 sound motion pictures of five minutes or longer duration made for other than Canadian sponsors.

Power Laundries, Dry Cleaning and Dyeing Plants.—In 1968,* the combined receipts of laundries and dry cleaning and dyeing plants increased by 2.1 p.c. over the previous year's level, reaching a new high of \$270,628,560. Power laundries reported revenues of \$108,714,737, 3.3 p.c. higher than in 1967, and dry cleaning and dyeing plants reported \$161,913,823, an increase of 1.4 p.c. In total, 2,554 laundries, dry cleaners and dyers employed 34,488 people and paid out \$124,605,691 in salaries and wages. The cost of materials and supplies used in their operations amounted to \$26,328,214—1.4 p.c. more than in 1967. The upward trends reflected in these statistics provide further evidence of the increasingly important role that such "personal service" trades have assumed in the economic life of the nation.

Advertising Agencies.—Billings of advertising agencies declined marginally during 1968* to \$426,144,921; commissionable billings (for advertising placed in publications, radio, television and other media) and those for market surveys, research and other fees were moderately lower than those for 1967, but billings for production work done by agency staff increased 9.1 p.c. Although both gross and net revenues fell below their comparable 1967 levels, the major decline was in net revenue (before income tax) which dropped 21.2 p.c.; gross revenue fell only fractionally.

* Latest data available at time of writing.

Table 28 shows the way in which commissionable billings of advertising agencies were allocated among the various media during 1965-68. Although radio's share remained more or less constant over this period, the amount devoted to television advertising increased from 27.4 p.c. to 30.4 p.c. At the same time, billings for advertising in publications declined from 39.5 p.c. to 35.6 p.c. and for other visual advertising forms from 3.7 p.c. to 2.8 p.c.

Funeral Directors.—A survey of funeral directors was undertaken for 1968 as a follow-up to a similar enquiry carried out four years earlier. It will be continued on an occasional basis to provide the industry (and other users of these statistics) with ratios and averages on the costs of funeral services. In 1968, there were 1,392 firms covered in the survey, with total receipts of \$97,056,229. Average funeral costs ranged from a low of \$371 in Newfoundland to a high of \$689 in Quebec.

Credit Statistics

Sales Financing.—During 1969, for the second consecutive year, the value of new financial paper purchased by Canadian sales finance companies rose markedly. The \$1,933,000,000 of new paper purchases—the highest value ever recorded—was 19.6 p.c. above the previous year's total. The increase was felt mainly in the commercial and industrial goods field, both for new and used commercial vehicles (up \$97,000,000 or 42.7 p.c.) and for other commercial goods (up \$132,000,000 or 44.6 p.c.). In the consumer goods field, new paper purchased on new passenger cars and other consumer goods rose by 11.7 p.c. but, for used passenger cars, purchases declined 2.1 p.c.

With the addition of a number of new companies for the first time, the outstanding balances of sales finance companies reached a new high in 1969 of \$2,180,000,000—22 p.c. above the year-end 1968 total. As shown in Table 30, the increases in balances outstanding reflect those registered under "paper purchased". The greatest area of growth (similar to purchases) was in the commercial and industrial goods field, where outstanding balances reached \$916,000,000, an increase of 38.4 p.c. over 1968.

¹ Totals are not the exact addition of the components because of rounding of the figures.

Consumer Credit.—Although the total volume of credit extended to consumers by retail stores and selected financial institutions has grown progressively from the early 1950s to its record high level of \$10,831,000,000 in 1969, the annual rates of increase have shown a tendency to decline during periods of credit restraint and weakness in buyer demand. The annual rate of increase in balances outstanding since 1963 averaged 12.7 p.c. During 1966, 1967 and again in 1969, however, "tight money" resulted in annual growth rates of 8.8 p.c., 10.8 p.c. and 13.0 p.c., respectively, compared with over 14 p.c. in other years. The chartered banks, consumer loan companies and credit unions have been the most active financial institutions engaged in this sphere of financing and have exhibited the largest propensity to growth in recent years. The figures in Table 31 are exclusive of various forms of service and personal credit on which no detailed information is available.

¹ Credit on consumer goods only.² Includes personal loans other than secured loans, home improvement loans and mortgages.³ Includes Quebec savings banks loans and oil company credit card balances.

Retail Credit.—This segment of consumer credit, comprising the value of accounts outstanding on the books of Canadian retailers (including department stores and their "captive" acceptance companies), has undergone a significant change during the 1960s in its relative position among institutions that extend credit to consumers. At the end of 1963, retail credit amounted to 20.6 p.c. of all consumer credit extended; by the end of 1969, however, this share had declined to 13.1 p.c. The latter figure reflects the relatively slower annual growth rate (4.5 p.c.) which has characterized retail credit during the past decade, as compared with the rate of 12.7 p.c. for all other selected credit holders in aggregate.

As shown in Table 32, retail store credit—including the charge accounts of motor vehicle dealers—amounted to \$1,550,000,000 at the end of 1969. Of this amount, the receivables of department stores, furniture, television, radio and appliance stores and motor vehicle dealers accounted for over two thirds. The 1969 total was 6.3 p.c. higher than at year-end 1968.

32.—Retail Credit, 1960-69, and by Kind of Business, 1969

Year	Accounts Receivable (at end of period)	Kind of Business	Accounts Receivable (at end of period)

¹ The charge accounts of motor vehicle dealers are not normally included as "consumer" credit (Table 31) since they are extended mainly to businesses rather than to consumers.

Section 2.—The Marketing of Agricultural Products*

Subsection 1.—The Grain Trade, 1968-69 and 1969-70

The 1968-69 Crop Year.—Estimated domestic supplies of wheat, oats, barley, rye, flaxseed and rapeseed totalled 2,285,300,000 bu. in the crop year 1968-69, 12 p.c. above the 1967-68 total of 2,036,100,000 bu. Marketings of these grains in the Prairie Provinces during the 1968-69 crop year amounted to 583,200,000 bu., which was a 4-p.c. decrease from the 1967-68 level of 609,000,000 bu. and an 8-p.c. decrease from the ten-year (1957-58-1966-67) average of 632,800,000 bu. Marketings of wheat at 423,200,000 bu. were down 7 p.c. and accounted for 73 p.c. of the total deliveries. Marketings of the other major grains, with totals for 1967-68 and ten-year averages, respectively, in brackets and in millions of bushels, were: oats, 41.6 (30.8, 45.8); barley, 81.8 (87.3, 93.7); rye, 3.8 (6.9, 7.3); flaxseed, 15.3 (7.9, 16.8); and rapeseed, 17.6 (20.0, 9.7).

As in the preceding year, an initial quota of 100 units was in effect at local delivery points at the beginning of the marketing year. Permit holders were entitled to deliver a maximum of 400 bu. of wheat or 1,000 bu. of oats or 600 bu. of barley or 600 bu. of rye or any combination of these grains which, when calculated on a unit basis, did not exceed 100. This initial unit quota was followed by general quotas based upon bushels per specified acre. [Specified acreage consisted of each permit holder's acreage seeded to wheat (including Durum), oats, barley and rye, the summerfallow acreage and the acreage seeded to eligible grasses and forage crops.] The first general quotas were established on Sept. 9, 1968.

Unfavourable weather during the fall season resulted in a substantial volume of the 1968 crop being harvested in damp condition. To assist producers holding large stocks of damp grain, and to maximize the use of drying facilities in terminals, the Canadian Wheat Board authorized, on Oct. 31, 1968, an advance quota delivery privilege for damp wheat, oats, barley and rye in excess of the established quotas, provided that the total quantity of grain delivered under the specified acreage quota plus this advance did not exceed a quota of 3 bu. per specified acre.

Stocks in commercial positions were relatively high throughout the 1968-69 crop year and the movement of grain into country elevators was therefore directly related to sales in both the export and domestic markets. The heavy farm supply of wheat, made up of a wheat carryover of 233,000,000 bu. and a 1968 production of 629,000,000 bu., resulted in large volumes being marketed at each quota level. For these reasons the general quotas advanced slowly throughout the crop year.

In the spring it appeared that, based on a normal delivery pattern, it would be possible to accept delivery of a 6-bu. quota. However, because of large-scale abuse of quotas, it became evident that it would not be possible to reach this goal and that some stations could not reach even a 5-bu. quota without additional car supply. The Board, therefore, entered into an agreement with the railway companies, under which cars were placed at delivery points where space was needed to enable most producers to complete delivery of the 5-bu. quota by the end of the crop year. On July 31, 1969, 12,406 cars were under-load to Thunder Bay compared with a normal under-load for that time of year of about 7,500 cars. This movement of grain from country positions should have been more than sufficient to permit delivery of a 5-bu. quota but, even with the additional effort by the railways and the grain companies, there were still 159 delivery points on the 4-bu. quota at the end of the crop year.

In July 1969, the Board instituted a policy to equalize delivery opportunities for producers who were not able to complete the full 5-bu. quota in the 1968-69 crop year. Under this policy, referred to as the Deferred Delivery Permit Policy, eligible producers received additional delivery privileges during the 1969-70 crop year.

Effective Aug. 1, 1968, a delivery quota of 5 bu. per acre seeded or 250 bu., whichever was greater, was established for flaxseed and for rapeseed. As in previous years, the producer

* Prepared in the Agriculture Division, Dominion Bureau of Statistics.

could deliver flaxseed or rapeseed within the existing quota to any delivery point at which space was available. On Oct. 31, 1968, the Board authorized an advance delivery quota on damp flaxseed and damp rapeseed in excess of the established quota, provided it did not exceed 8 bu. per seeded acre or 400 bu., whichever was larger. On Feb. 17, 1969 the rapeseed quota was increased to 8 bu. per seeded acre or 400 bu. The flaxseed quota was declared open at all delivery points for the balance of the 1968-69 crop year on Jan. 17, 1969 and for rapeseed on Mar. 4, 1969.

*Wheat.**—Domestic supplies of wheat in 1968-69 were at an all-time high of 1,315,400,000 bu., 12 p.c. above the 1967-68 total of 1,169,700,000 bu. and 5 p.c. more than the previous record of 1,247,500,000 bu. in 1966-67. The 1968 production of wheat was 649,800,000 bu. compared with 592,900,000 bu. in 1967 and carryover stocks were 665,500,000 bu. compared with 576,800,000 bu. Exports of wheat and flour in terms of wheat, at 305,800,000 bu., were 9 p.c. below the 336,000,000 bu. exported in 1967 and 24 p.c. less than the ten-year average of 402,900,000 bu., but surpassed the long-term average of 304,600,000 bu.

During the crop year 1968-69, marketing of western Canadian wheat was again conducted by the Canadian Wheat Board on a one-year Pool basis, the initial payment being \$1.70 per bu. basis No. 1 Northern in store Thunder Bay or Vancouver. There were no adjustment or interim payments on the 1968-69 wheat Pool but a Government payment on Durum wheat amounting to \$6,555,614 was announced on May 12, 1970.

The International Grains Arrangement (IGA) came into effect on July 1, 1968, replacing the International Wheat Agreement (IWA), which had been in effect since Aug. 1, 1962. The IGA consists of two legal instruments—a Wheat Trade Convention and a Food Aid Convention. The International Wheat Council established under the IWA remains for the purpose of administering the Wheat Trade Convention and of providing service to the Food Aid Committee.

At the start of the 1968-69 crop year, export prices were generally at or slightly above IGA minimum levels, but came under severe pressure as the third successive bumper wheat crop was harvested in 1968, resulting in extreme competition for available markets from both IGA member exporters and non-member suppliers. Thus, there was a general decline in the prices of soft wheat which were in the heaviest supply position. In addition, quality wheats from Australia and the Soviet Union came on the European market in quantity for the first time, on a guaranteed protein basis at prices well below prices for comparable wheats as set out in the IGA schedule.

Efforts were made in the Prices Review Committee to stabilize the market and prevent the erosion of prices below IGA minimum levels. The Committee was asked to establish minimum prices for new grades and qualities coming into prominence which were not listed in the schedule to the Convention, and to establish related prices for wheats available from non-member countries. This latter procedure is implicit in the agreement to enable importers to fulfil their commitment to purchase wheat from non-member countries at prices consistent with the price range established under Article 6. It proved impossible within the Committee to reach a consensus on such price levels for unscheduled wheat and, consequently, there was further deterioration in soft wheat prices due to competitive factors and, in the quality wheats, the new types began to take over a substantial share of the commercial market. This development affected Canada, particularly in Britain and Western Europe, and in March 1969 Canada informed the Prices Review Committee that it could no longer strictly observe the IGA minimum prices as established for Canadian grades but must meet competition in the marketplace. In subsequent months, there were successive downward movements in the export prices of most wheats to the extent that by the end of the crop year wheat was generally trading at levels substantially below IGA minima.

Following on the failure of the Prices Review Committee to cope with this situation, the exporters multilaterally began a series of detailed technical discussions to identify specific technical difficulties in price determination and to co-ordinate their policies so as to

* The data dealing with the operation of the International Grains Arrangement was taken from the 1968-69 Annual Report of the Canadian Wheat Board.

stabilize and strengthen the price situation to the degree possible. These meetings continued into the new crop year, outside the venue of the IGA, and by mid-September had been successful in achieving a high degree of stability in the international market and a greater degree of co-operation and understanding of mutual problems among the major exporters.

The 1968-69 exports of bulk wheat, at 280,500,000 bu., were below the preceding year's total of 310,700,000 bu. and also lower than the recent ten-year average of 362,900,000 bu. During the 1968-69 crop year, the People's Republic of China became Canada's principal wheat customer, importing 82,000,000 bu.; Britain was Canada's second largest wheat market with imports of 55,700,000 bu. and Japan third with purchases of 43,300,000 bu. Other leading markets during 1968-69, with quantities in millions of bushels (1967-68 figures in brackets), were: India, 15.3 (22.4); Italy, 15.2 (10.2); Federal Republic of Germany, 12.8 (17.5); Belgium and Luxembourg, 7.5 (9.9); Netherlands, 5.8 (5.0); Switzerland, 5.7 (2.6); France, 4.4 (0.9); Poland, 3.4 (5.8); and Venezuela, 3.0 (3.1).

The export movement of Canadian wheat flour during the 1968-69 crop year amounted to 10,700,000 cwt. (24,600,000 bu. of wheat equivalent), unchanged from the 1967-68 total. Cuba was Canada's major customer for wheat flour, taking 5,400,000 cwt., or 12,500,000 bu. of wheat equivalent, and accounting for 51 p.c. of the crop year total; Britain, with imports equivalent to some 2,500,000 bu., accounted for 10 p.c. of the crop year total and Ghana imported 1,300,000 bu.

SUPPLY AND DISPOSITION OF CANADIAN WHEAT CROP YEARS ENDED JULY 31, 1960-69

Other Grains.—During the 1968-69 crop year, initial payments for oats, basis No. 2 C.W. in store Thunder Bay, and barley, basis No. 3 C.W. Six-Row in store Thunder Bay, were 65 cents per bu. and 106 cents per bu., respectively, the same as in 1967-68. There were no final payments on the 1968-69 oats and barley Pools.

Combined exports of oats, seed oats, barley, rye, flaxseed and rapeseed (including Customs exports of oatmeal and rolled oats, and malt in terms of grain equivalent) amounted to 61,100,000 bu. during the crop year 1968-69. This figure was below the comparable 1967-68 level of 74,600,000 bu. and the ten-year (1957-58—1966-67) average of 89,900,000 bu.

Exports of Canadian oats in bulk totalled 2,300,000 bu. during 1968-69 compared with 3,100,000 bu. during the previous year. The major market for this grain was the United States which imported 900,000 bu., and other shipments went to the Netherlands, 400,000 bu.; Egypt, 300,000 bu.; Ireland and Switzerland, 200,000 bu. each; Britain and Belgium and Luxembourg, 100,000 bu. each. Exports of Canadian oatmeal and rolled oats amounted to the equivalent of 79,000 bu. in 1968-69 against 95,000 bu.

Barley exports, at 21,200,000 bu., declined sharply from the 1967-68 level of 36,100,000 bu. Britain was Canada's major customer, increasing its imports in 1968-69 to 10,900,000 bu. from 1,900,000 bu. in 1967-68 and replacing Japan which reduced its purchases from 15,400,000 bu. in 1967-68 to less than 1,000,000 bu. The United States purchased 7,700,000 bu., compared with 4,400,000 bu. in 1967-68 and Israel took 1,300,000 bu., Ireland, 500,000 bu. and U.S. Oceania, 100,000 bu. Shipments of malt were the equivalent of 5,200,000 bu. compared with 5,300,000 bu. in 1967-68; they went to 21 different destinations, the major markets being Japan, 1,100,000 bu.; United States, 1,000,000 bu.; and the Philippines and Venezuela, 700,000 bu. each.

Exports of Canadian rye amounted to 4,200,000 bu. in 1968-69 compared with 4,800,000 bu. in the previous year. The principal markets were Japan, 1,600,000 bu.; Norway and the United States, 900,000 bu. each; Britain, 500,000 bu.; and the Netherlands, 300,000 bu.

During 1968-69, clearances of Canadian flaxseed moving overseas amounted to 13,400,000 bu. against 12,600,000 bu. in the previous year. Japan was the leading market, importing 4,900,000 bu., followed by the Netherlands and Britain with 2,200,000 bu. each and the Federal Republic of Germany with 1,400,000 bu. Smaller shipments went to some 15 other overseas destinations. Most of the exports of linseed oil, equivalent to about 500,000 bu. of flaxseed, went to Britain. Trade in rapeseed amounted to 14,300,000 bu., an all-time high for this oilseed; Japan purchased 10,900,000 bu. Mustard seed exports, at 3,160,000 bu., were also above the 1967-68 level of 2,200,000 bu. and went mainly to the United States, the Netherlands, Belgium and Luxembourg, Japan and the Federal Republic of Germany.

The 1969-70 Crop Year.—The 1969-70 crop year opened with carryover stocks of the six major grains (wheat, oats, barley, rye, flaxseed and rapeseed) at 1,199,000,000 bu. Stocks of wheat at Aug. 1, 1969 amounted to 851,800,000 bu., significantly higher than the 665,500,000 bu. held in storage a year earlier. Aug. 1 stocks of the other major grains in millions of bushels (1968-69 figures in brackets) were: oats, 128.7 (77.0); barley, 199.4 (130.9); rye, 8.7 (7.5); flaxseed, 4.9 (4.7); and rapeseed, 5.1 (9.9).

Domestic production of the six major grains reached 1,511,500,000 bu. in 1969-70. Wheat increased to 684,300,000 bu. from 649,800,000 bu. in 1968-69, resulting in a total supply for the 1969-70 crop year of 1,536,100,000 bu., an all-time high. Oats rose to 371,400,000 bu. from the previous crop-year total of 362,500,000 bu., resulting in a supply of 500,000,000 bu. in 1969-70. An estimated 378,400,000 bu. of barley were produced which, combined with opening stocks, resulted in a supply for 1969-70 of 577,800,000 bu. Rye production rose to 16,500,000 bu. from 13,000,000 bu. in 1968-69, resulting in a supply for 1969-70 of 25,200,000 bu. Flaxseed and rapeseed production also increased to 27,500,000 bu. and 33,400,000 bu., respectively, the supplies amounting to 32,500,000 bu. and 38,500,000 bu., respectively.

Farmers' marketings of the six grains during the 1969-70 crop year amounted to 659,300,000 bu., an increase of 13 p.c. over the 1968-69 total of 583,200,000 bu. Deliveries of wheat and oats were lower than in 1968-69, but the other grains registered increases. Marketings of wheat at 411,800,000 bu. were down by 2.7 p.c. and accounted for 62.4 p.c. of all deliveries. Marketings of the other major grains in millions of bushels (1968-69 totals in brackets) were: oats, 21.0 (41.6); barley, 168.4 (81.8); rye, 7.6 (3.8); flaxseed, 22.1 (15.3); and rapeseed 28.5 (17.6).

During 1969-70, Canada exported 476,900,000 bu. of the six major grains, including 27,000,000 bu. of wheat flour in terms of wheat equivalent. Export clearances of wheat rose to 317,700,000 bu., some 13 p.c. above the 1968-69 total of 280,500,000 bu. but nearly 14 p.c. below the ten-year (1959-60—1968-69) average of 369,200,000 bu. Exports of oats at 4,800,000 bu. were more than double the 1968-69 total of 2,300,000 bu. Barley exports rose to 82,700,000 bu. from the 1968-69 level of 21,200,000 bu. and rye exports declined to 3,800,000 bu. from 4,200,000 bu. Flaxseed and rapeseed exports both registered large gains in 1969-70, rising to 18,600,000 bu. from 13,400,000 bu. and 22,200,000 bu. from 14,300,000 bu., respectively.

Total domestic consumption of wheat in Canada rose to 178,600,000 bu. in 1969-70 from 157,700,000 bu. in 1968-69, largely as a result of increased use of wheat in livestock feeding. Domestic utilization of oats rose to 352,500,000 bu. from 308,100,000 bu., of barley to 287,700,000 bu. from 230,500,000, of rye to 10,600,000 bu. from 7,600,000 bu., of flaxseed to 8,000,000 bu. from 6,000,000 bu. and of rapeseed to 12,600,000 bu. from 9,900,000 bu.

Stocks of wheat at the close of the crop year on July 31, 1970 stood at 1,011,000,000 bu., 19 p.c. above the closing stocks of the previous year. Year-end stocks of the other major grains in bushels, were: oats, 142,300,000 bu.; barley, 201,800,000 bu.; rye, 10,700,000 bu.; flaxseed, 5,800,000 bu.; and rapeseed, 3,700,000 bu.

33.—Supply and Disposition of Canadian Grain, Crop Years Ended July 31, 1968 and 1969 (Millions of bushels)

Miscellaneous Grain Trade Statistics

Grain Handled at Eastern Elevators.—Total receipts of the six major grains at eastern elevators in the 1968-69 crop year amounted to 270,219,000 bu., 5 p.c. more than in the previous crop year. Shipments, amounting to 245,906,000 bu., were down 11 p.c. from the 1967-68 level of 275,190,000 bu.

Lake Shipments of Grain.—The 1969 navigation season opened at the Canadian Lakehead on Apr. 11 and closed on Dec. 23. During the season, shipments of wheat, oats, barley, rye, flaxseed, rapeseed and mustard seed totalled 263,921,000 bu., an increase of 6 p.c. over the 247,978,000 bu. shipped during the 1968 navigation season which opened on Apr. 10 and closed on Dec. 19.

Licensed Grain Storage.—Total grain storage capacity in Canada, licensed under the provisions of the Canada Grain Act by the Board of Grain Commissioners for Canada, amounted to 700,349,000 bu. at Dec. 1, 1968, the increase over the same date of 1967 being 6,975,000 bu. Greater capacity in Western country elevators and Pacific Coast elevators more than offset decreases in interior private and mill, and Georgian Bay and upper Lake ports. Table 37 gives the amount in storage at three dates during the year. On July 31, 1969, 77.3 p.c. of the licensed storage capacity was occupied as compared with 70.8 p.c. on the same date of 1968.

¹ Wheat, oats, barley, rye, flaxseed and rapeseed.

Production and Exports of Wheat Flour.—Production of wheat flour in the 1968-69 crop year amounted to 37,621,000 cwt. and wheat milled for flour totalled 85,049,000 bu., the figures being little changed from those for 1967-68. Of the wheat milled for flour, approximately 71,010,000 bu. were Western Canadian spring wheat (other than Durum) and the remainder was made up of 8,309,000 bu. of Ontario winter wheat, 4,572,000 bu. of Durum wheat and 1,158,000 bu. of other types. Utilization of milling capacity, based on a daily operating potential of some 174,000 cwt., averaged 73.9 p.c. in 1968-69 compared with 80.2 p.c. in the previous year. Exports of wheat flour in 1968-69 amounted to 10,705,000 cwt. compared with 10,735,000 cwt. exported in 1967-68.

1968-69	85,049	37,621,151	10,705,452	28.5

Subsection 2.—Livestock Marketings*

The main feature of the livestock market in 1969 was the rise in prices in all departments of the trade to produce an all-time record value of commercial marketings at \$1,422,000,000, an increase of 10 p.c. in sales revenue over the previous year. Reduced production, heavier weights and somewhat better quality contributed to the rise in prices and strong domestic demand ensured good weekly clearances despite limited export trade.

Marketings of cattle sold through public stockyards, shipped directly to packing plants, on export and to country points in another province numbered 3,330,729 head, down 4 p.c. from the total of the previous year. All western provinces contributed to the decline, British Columbia and Saskatchewan showing the sharpest reductions at 14.6 p.c. and 14.3 p.c., respectively. On the other hand, all eastern provinces except Newfoundland had heavier marketings, Quebec recording the greatest increase at 20 p.c. Calf marketings followed a similar pattern. The volume of sales at 1,206,685 head was 10.4 p.c. lower than in the previous year and the lowest in the previous five years, with Quebec establishing an all-time record output of 415,867 head. Cattle slaughtered in federally inspected establishments averaged 566 lb. per carcass, more than 6 lb. heavier than the 1968 average; 62.5 p.c. graded choice and good quality compared with 56.8 p.c. in the previous year, representing the best quality turnout since the inception of official beef grading. Prices for all classes and grades of cattle at \$26.65 averaged \$3.45 per cwt. higher than in 1968; choice steers and heifers rose \$2.45 and \$2.25, respectively, with corresponding gains in lower grades of both classes. Throughout the year demand was keen for fed cattle which, coupled with an abundance of feed grain available in Western Canada, resulted in a strong market on all classes of replacements. Good feeder steers at \$31.20 showed an increase of \$4.50 over 1968, and good stock steer calves, which made up 24.5 p.c. of total calves marketed through public stockyards, at \$37.55 were \$7.55 above the 1968 price. Prices for veal and butcher calves were also sharply higher—\$4.00 to \$5.00 above the previous five-year averages—with supplies usually not sufficient to meet the demand.

Marketings of hogs in 1969 at 7,481,479 were 8 p.c. lower than in 1968. Of the western provinces, only Manitoba showed an increase in production with 3.5 p.c. over the previous year, and Alberta had the sharpest reduction at 16.6 p.c.; all Atlantic Provinces recorded minor increases but production in both Ontario and Quebec also declined. There was a complete change in hog classification in 1969, so that quality figures for that year given in

* More detailed information is available from DBS annual report *Livestock and Animal Products Statistics* (Catalogue No. 23 293), and the Canada Department of Agriculture publication *Livestock Market Review*. Statistics of livestock and poultry production and disappearance are given on pp. 582-585.

Table 39 cannot be compared with those of previous years; however, indications are that it was at least equal to that of 1968. Manitoba had the lowest quality grading and the Atlantic Provinces, following the pattern of recent years, produced the highest percentage in the top grades. The average price for hogs with an Index of 100 was \$35.20 in 1969, an increase of \$6.40 per cwt., and the value per carcass was correspondingly higher at \$57.40 compared with \$46.35 in 1968.

Sheep and lambs shipped to public stockyards, packing plants and on export during 1969 totalled 267,098, a reduction of 19.3 p.c. from the previous year, the lowest ever reached since collection of these statistics was begun in 1920. Although quality remained relatively equal to the previous year's grading and the average price of good lambs was \$30.45 compared with \$26.85 in the previous year, prospects for improvement in the sheep and lamb trade are not indicated.

Section 3.—Co-operative Organizations*

Business volume of co-operatives dropped during 1968 with the slowdown of Canadian wheat exports. Total revenue of 2,469 local co-operatives amounted to \$2,132,900,000, a decline of \$47,000,000 or 2 p.c. from 1967, and included farm product marketings \$1,332,700,000, sale of merchandise and supplies \$720,100,000, service revenue (trucking, cold storage, grazing, etc.) \$66,100,000 and miscellaneous income (rent, interest, dividends, etc.) \$14,100,000. Total assets of the co-operatives amounted to \$1,177,200,000 and members' equity therein was 45 p.c. Continuing the trend toward consolidation of units, the number of associations declined during the year to 2,469 while reported membership rose by 35,000 to 1,723,000. Marketing and purchasing co-operatives, which market members' produce and retail merchandise and supplies to members, have always been the dominant types of co-operatives and have for many years accounted for more than 90 p.c. of co-operatives' business volume, with service and fishermen's co-operatives contributing the remainder.

Total revenues of marketing and purchasing co-operatives at \$2,039,900,000 eased by \$51,000,000 or 2 p.c. in 1968, due to a decline in western grain marketings which more than offset gains in most other revenue items. Total revenues consisted of: farm product marketings, \$1,285,600,000; retailing of merchandise and supplies, \$715,000,000; service revenue, \$27,100,000; and miscellaneous income, \$12,200,000. Farm product marketings declined by \$87,000,000 or 6 p.c., with a sharp decline of \$104,000,000 or 19 p.c. in Prairie grain marketings far outweighing a modest aggregate gain of \$17,000,000 in marketings of other farm products. Livestock marketings were down slightly due to a substantial decline in

* Prepared in the Economics Branch, Canada Department of Agriculture, Ottawa.

Ontario, while a mixture of higher poultry meat prices and lower egg prices resulted in a negligible over-all gain of less than 1 p.c. in co-operative marketings of these products in 1968. Co-operative dairy marketings rose 3 p.c. to \$344,000,000, although Canadian dairy production and producer returns were almost unchanged during the year. Fruit and vegetable marketings rose 6 p.c. to \$51,000,000 based on a combination of record apple production and good prices for the crop year 1967-68. Wool and miscellaneous marketings declined but honey and tobacco registered increases. Sales of merchandise and supplies by co-operatives were up a modest 5 p.c. in 1968 as compared to a jump of 12 p.c. in the previous year. Machinery sales were down in the Prairie Provinces and feed sales slipped in Ontario where a bumper grain crop lessened purchases of western feed grains. All other sales categories rose including food products and petroleum which posted their usual steady gains while the growth rate of fertilizer levelled off somewhat as compared to the preceding four-year period in which sales more than doubled. Assets of the marketing and purchasing co-operatives recorded a huge increase of \$154,000,000 or 18 p.c., attributable mainly to the accumulation of Prairie grain inventories, a stepped-up program of modernization and expansion of facilities by the wheat pools, and a rationalization of the dairy industry in Quebec involving the consolidation of plants into a smaller number of larger, more efficient units. Three quarters of the increase in assets were financed by liabilities to the public, almost all of it in the form of short-term loans.

Service co-operatives provide services to their members such as trucking, cold storage, grazing, medical insurance, rural electrification, etc., and, in conjunction with their main function, some service co-operatives are engaged in the marketing of farm products and the sale of supplies. For 1968, total business volume of 1,071 service co-operatives with a membership of 316,000 amounted to \$65,100,000 and included service revenue of \$38,427,000, sales of farm products and supplies of \$24,971,000 and miscellaneous income of \$1,727,000. Assets of the service co-operatives totalled \$129,709,000 at year-end of which members' equity represented 62 p.c. Fishermen's co-operatives, of which there were 86 reporting for 1968 with membership of 8,000, had a total business volume of \$28,302,000, including fish marketings of \$24,220,000, fishing and other supplies of \$3,191,000, and service revenue and other income of \$891,000. Assets amounted to \$17,600,000.

Wholesale co-operatives are federations of local co-operatives which act as central marketing agencies and distributors for the farm products and supplies of the local co-operatives. Their sales are reported separately from those of the local co-operatives, since they are largely a duplication of the sales made by the locals. Sales volume of the eight co-operative wholesales for 1968 was \$560,200,000, a modest increase of \$18,000,000 or 3 p.c. over the previous year. Supply sales came to \$363,100,000, of which the largest items were food products \$106,000,000, feed \$80,800,000, and petroleum \$63,900,000. Marketing of farm products totalled \$197,100,000 including livestock \$88,200,000 and dairy products \$52,200,000. Assets for the eight wholesales and one wholesaler for the other wholesales amounted to \$213,700,000 at year-end 1968.

The first Eskimo co-operative in Canada was incorporated in 1959. Twenty-seven co-operatives and two credit unions have since been formed in the Northwest Territories, with another nine co-operatives and a *caisse populaire* in northern Quebec. Primarily production organizations, they have helped to preserve and to promote native arts and crafts, and are now engaged in a multiplicity of activities. Their combined trading figure in 1968 approximated \$2,500,000 and their assets were valued at \$2,136,000, of which members held a 42-p.c. equity built up within ten years from literally nothing. Over the same period an additional \$5,000,000 was earned by members in wages and by marketing their products through co-operatives. These amounts probably represent a more substantial return to local people than that generated by any other business organization in the North. The transfer of the responsibility for the co-operative development program from the Federal Government in Ottawa to the Northwest Territories Government in Yellowknife in 1969 brought supervisory and advisory services much closer to the co-operatives in the Territories. Since 1967, co-operatives in northern Quebec have been serviced through their own federation, which was formed in that year.

PART II.—GOVERNMENT AIDS TO AND CONTROL OF DOMESTIC TRADE

Section 1.—Controls Affecting the Marketing of Farm Products

Subsection 1.—Control of the Grain Trade

The agencies exercising control of the grain trade in Canada include the Board of Grain Commissioners for Canada which, since 1912, has administered the provisions of the Canada Grain Act, and the Canadian Wheat Board which operates under the Canadian Wheat Board Act, 1935.

The Board of Grain Commissioners for Canada.—The Board of Grain Commissioners was established in 1912 under the authority of the Canada Grain Act, 1912 (RSC 1952, cc. 25 and 308 and amendments). It is a quasi-judicial and administrative body of three—a chief commissioner and two commissioners—reporting to the Minister of Agriculture.

The Canada Grain Act has been called the Magna Charta of the Canadian grain trade or, more particularly, of the Canadian farmer, and the Board's chief duties are to ensure that the rights conferred on the different parties by the provisions of the Act are properly protected. Transportation of grain is restricted except from or to licensed elevators, and restriction is placed on the use of established grade names. The Act does not provide for any control or supervision of grain exchanges and the Board of Grain Commissioners has no power or duties in the matter of grain prices.

The Board manages and operates, under semi-public terminal licences, the Canadian Government elevators situated at Moose Jaw and Saskatoon, Sask., Lethbridge, Edmonton and Calgary, Alta., and Prince Rupert, B.C. The Executive Offices of the Board and other principal offices are situated at Winnipeg, Man., but branch offices are maintained at numerous points from Montreal in the east to Victoria in the west. Total personnel is approximately 1,000, including Canadian Government elevator staff.

On a fee basis, the Board provides official inspection, grading and weighing of grain, and registration of warehouse receipts. All operators of elevators in Western Canada and of elevators in Eastern Canada that handle western-grown grain for export, as well as all parties operating as grain commission merchants, track buyers of grain, or as grain dealers, are required to be licensed by the Board annually and to file security by bond or otherwise as a guarantee for the performance of all obligations imposed upon them by the Canada Grain Act or by the regulations of the Board.

To protect the rights of the different parties, the Board has jurisdiction to inquire into and is empowered to give direction regarding any matter relating to the grading or weighing of grain; deductions made from grain for dockage; shortages on delivery of grain into or out of elevators; unfair or discriminatory operation of any elevator; refusal or neglect of any person to comply with any provision of the Canada Grain Act; and any other matter arising out of the performance of the duties of the Board.

In the Prairie Provinces, the Board maintains four assistant commissioners—one in Alberta, two in Saskatchewan and one in Manitoba. These assistant commissioners investigate complaints of producers and inspect periodically the country elevators in their respective provinces; all elevators with their equipment and stocks of grain are subject to inspection by officials of the Board at any time.

The Board sets up, annually, Committees on Grain Standards and also appoints Grain Appeal Tribunals to give final decisions in cases where appeals are made against the grading of grain by the Board's inspection officials. To assist in maintaining the uniform quality of the top grades of Red Spring wheat handled through terminal elevators, the Canada Grain Act provides that wheat of these grades shall be stored with grain of like grade only.

The Board's Research Laboratory, located at Winnipeg, is the main centre of research on the chemistry of Canadian grains. It is well staffed and equipped to provide the service required to help maintain and expand domestic and foreign markets for all types of grain. The Laboratory collects and tests samples to obtain information on the quality of the various grain crops grown each year and on the quality of grain shipped. Basic research is also undertaken, the program being directed toward better understanding of what constitutes quality in cereal grains and toward improvement in the methods of assessing quality.

In addition to its duties under the Canada Grain Act, certain other duties are performed by the Board. Under the provisions of the Inland Water Freight Rates Act (RSC 1952, c. 153), the Board maintains records of rates for the carriage of grain from Thunder Bay, Ont., by lake or river navigation and is empowered to prescribe maximum rates for such carriage. Under the provisions of the Prairie Farm Assistance Act (RSC 1952, c. 213 as amended), the Board collects from licensees under the Canada Grain Act 1 p.c. of the purchase price of wheat, oats, barley, rye, flaxseed and rapeseed purchased by such licensees.

The Canadian Wheat Board.—The Canadian Wheat Board was established under the Canadian Wheat Board Act of 1935 for the purpose of "the marketing in an orderly manner, in interprovincial and export trade, of grain grown in Canada" and now operates under RSC 1952, c. 44 as amended. The Board accomplishes its objective through regulation and agreement. It owns no grain handling facilities but, by entering into agreements with the owners of these facilities, it attempts to bring about an orderly flow of grain through each of the steps involved in merchandising the grain from the producer to the domestic or overseas buyer.

In the selling of wheat, the Board utilizes the services of shippers and exporters. In its sales operations, the Board endeavours to meet the wishes of overseas buyers and, on occasion, enters into direct contracts. When an exporter completes an export sale, in his capacity as an agent of the Board, he is responsible for the transaction; he completes the transaction with the buyer and settles with the Board for the purchase of the wheat from the Board.

When the commercial storage facilities are inadequate to handle all the grain produced, it is necessary for the Board to regulate the flow of grain from the producer to these forward positions. The first step is accomplished by the use of producer's delivery permits issued annually by the Canadian Wheat Board. Every delivery of grain made to country elevators by a producer is entered in his permit book. By regulating the amount of grain delivered by the producer to the country elevator by the use of a quota system and, by apportioning shipping orders to country elevators according to the needs created by sales commitments, the Wheat Board regulates the amount of grain coming into the marketing channel.

The next step is the handling of the grain by the country elevator. The maximum charges for the handling and storing of the grain are set by the Board of Grain Commissioners, but the actual charges are subject to negotiation between the elevator companies and the Wheat Board.

The third step in the marketing process—transporting the grain from the country elevators to large terminal elevators in Eastern Canada, Churchill or on the West Coast—is carried out by the railways. The Wheat Board determines the kinds and grades of grain that are required at the different terminal destinations to meet its sales commitments and informs the elevator companies and the railways of these needs. The maximum tariffs are set by an agreement between the railways and the Government of Canada.

The fourth major step—storing and handling of the grain at terminal elevators—is done in privately or co-operatively owned elevators. Maximum charges are established for this service by the Board of Grain Commissioners.

In the case of oats and barley, the Board's operations are less extensive than those relating to wheat. These two grains are sold in store positions at the terminal elevators

at Thunder Bay and Vancouver. Oats and barley are marketed either on a straight cash basis at prices quoted daily by the Board or on the basis of exchange of futures concluded through the facilities of the Winnipeg Grain Exchange. The Board controls the movement of coarse grains to Thunder Bay. The private trade is responsible for the movement of oats and barley from Thunder Bay or Vancouver positions.

The producer receives payment for his wheat, oats and barley in two or three stages. An initial payment price is established early in the crop year by Order in Council. The initial payment price less the cost of handling grain at the local elevator and the transportation costs to Thunder Bay or Vancouver is the initial price received by the producer. This price is a guaranteed floor price in that if the Wheat Board, in selling the grain, does not realize this price and the necessary marketing costs, the deficit is borne by the Federal Treasury. However, with very few exceptions, the Wheat Board has operated without financial aid from the Federal Treasury.

After the end of the crop year, but prior to the final payment being made, if the Wheat Board can confidently foresee a surplus accumulating and if authorized by Order in Council, an interim payment is made to producers. This interim payment is the same amount per bushel to all producers of the same grade of grain. When the Board has sold all the grain or otherwise disposed of it in accordance with the Canadian Wheat Board Act, the Board, if authorized by Order in Council, makes a final payment to producers.

Under the Prairie Grain Advance Payments Act, administered by the Board, producers may receive, through their elevator agents, cash advances on farm-stored grain in accordance with a prescribed formula. The purpose of this legislation is to make cash available to producers pending delivery of their grain under delivery quotas established by the Board. Cash advances are interest-free as far as producers are concerned.

Western Canadian producers receive the price for their grain that the Wheat Board receives, less its operating costs including carrying charge, and the general level of prices received by the Board is determined by competitive conditions in world markets. The only subsidy received by the farmer in the Canadian wheat marketing system is the part-payment of storage costs for wheat made by the Government of Canada. Under provisions of the Temporary Wheat Reserves Act, the Minister of Finance, out of the Consolidated Revenue Fund, pays to the Wheat Board the storage costs on wheat in storage at the end of the crop year in excess of 178,000,000 bu.

Subsection 2.—Controls Over Farm Products Other Than Grain*

The Government of Canada and provincial governments have, through legislation and in other ways, given marketing aids such as those related to research, education, information, inspection, grading and many other service measures of this type, designed to assist in making adjustments in marketing within agriculture and between agriculture and the remainder of the economy. Closely related is regulatory action designed to protect the consumer.

Producers have been concerned about another type of market control, namely that which will give either their organizations or a government agency influence over the price received. In a highly specialized commercial agriculture such as Canada now has, the producer is dependent on the price of his product for his livelihood. Canadian farmers have long attempted to obtain some measure of market control through voluntary organizations, mainly marketing co-operatives. All provinces have made provision for the incorporation of such co-operatives and most, if not all, have provided other assistance to them. In the federal field, the Agricultural Products Co-operative Marketing Act encourages marketing under a co-operative plan.

Other legislation provides for legal control over the marketing of agricultural products, either by a producer board or a government agency. Legislation of this type includes

* Prepared in the Economics Branch, Canada Department of Agriculture, Ottawa.

that pertaining to milk control boards, to producer marketing boards and to industry marketing commissions. Measures pertaining to grain marketing have been reviewed in Subsection 1, pp. 1036-1038, and the Agricultural Stabilization Act, which provides price support for certain key products is discussed in the Agriculture Chapter, pp. 557-558.

Product Controls.—The federal and provincial departments of agriculture co-operate in establishing and enforcing grades of quality standards for various foods. Some control over size and type of containers used for distribution of agricultural products is exercised by the Canada Department of Agriculture and the Department of Consumer and Corporate Affairs enforces regulations pertaining to weights and measures (see p. 1050).

Controls related to health and sanitation in food handling are developed and enforced at all three levels of government—municipal, provincial and federal. Examples of provincial and municipal action include laws pertaining to the pasteurization of milk, inspection of slaughter-houses and sanitary standards in restaurants. At the federal level, inspection by the Health of Animals Branch of the Department of Agriculture of all meat carcasses that enter into interprovincial trade is required. The Food and Drug Directorate of the Department of National Health and Welfare has wide control over the composition of foods and over misleading advertising of foods and drugs.

Marketing Controls.—*The Agricultural Products Co-operative Marketing Act.*—In the late 1930s, the Federal Government decided to assist orderly marketing by encouraging the establishment of pools which would give to the producer the maximum sales return for his product, less a maximum margin for handling expenses agreed upon in advance. Thus, the Agricultural Products Co-operative Marketing Act and the Wheat Co-operative Marketing Act were passed in 1939. The latter was used in one year only but the Agricultural Products Co-operative Marketing Act, which covers the marketing of all agricultural products, except wheat produced in the Canadian Wheat Board area, has served agricultural producers continuously since 1939.

The purpose of this Act is to aid farmers in pooling the returns from sale of their products by guaranteeing initial payments and thus assisting in the orderly marketing of the product. The Government may undertake to guarantee a certain minimum initial payment to the producer at the time of delivery of the product, including a margin for handling; sales returns are made to the producer on a co-operative plan. The guaranteed initial payment may be up to a maximum of 80 p.c. of the average price paid to producers for the previous three years, the exact percentage to be recommended by the Minister of Agriculture who enters into an agreement with the selling agency for the product. During 1969, agreements were made for the marketing of apples for processing in Quebec and beans in Ontario.

Milk-Control Legislation.—Most of the provinces enacted milk-control legislation prior to 1940. Most provinces finance these milk-control agencies partly from public funds and partly through the collection of licence fees and assessments from those engaged in the fluid milk industry. The Ontario board is now financed wholly through licence fees. Milk-control agencies have the authority to license those engaged in the fluid milk industry and can revoke licences for failure to conform with the orders of the milk-control board.

In all provinces with such boards, the milk-control board or similar agency sets the minimum price which distributors in specified markets may pay producers for Class I milk, that is, milk actually sold for fresh fluid consumption. In British Columbia, a formula is used as a guide in determining minimum prices to producers. Most provinces set either minimum or maximum wholesale and retail prices for fluid milk. Quebec sets a minimum and maximum price range. Saskatchewan sets minimum prices applicable to all retail milk sales and maximum prices applicable to milk sales from retail wagons, as well as a minimum-maximum price range at the wholesale level. Minimum prices are in effect in Alberta, Nova Scotia and New Brunswick. Maximum prices are set in Manitoba and no

control is exercised over milk prices at the wholesale and retail levels in Ontario and British Columbia. In these three provinces some degree of price competition has developed between store sales and home delivery.

The powers given to or requirements made by milk-control boards include: (1) authority to inquire into all matters pertaining to the fluid milk industry, to define market areas, to arbitrate disputes, to examine the books and records of those engaged in the industry, to issue and revoke licences, and to establish a price for milk; and (2) authority to require a bond from distributors, periodic reports from distributors, payments to be made to producers by a certain date each month, distributors to give statements to suppliers, distributors to give notice before ceasing to accept milk from any producer, and producers to give notice before ceasing to deliver milk to any distributor.

The Ontario Milk Marketing Board, a producer-controlled agency, was officially established by the Milk Commission of Ontario on Nov. 1, 1965. The Board was delegated certain powers by the Commission in respect to the production, marketing and transportation of milk and has the power to set the price that milk distributors must pay to their suppliers.

The Canadian Dairy Commission.—The Canadian Dairy Commission was established by Federal legislation and commenced operations on Apr. 1, 1967. This is a new departure in the area of agricultural marketing because it is the first national marketing board to be established since the Canadian Wheat Board was created in 1935. The Commission has the power to purchase any dairy product and package, process, store, ship, insure, import, export, or sell or otherwise dispose of any dairy product purchased by it. The Commission may also make payments to producers of milk and cream for the purpose of stabilizing the price of these products.

The objects of the Commission are to provide producers of milk and cream with the opportunity of obtaining a fair return for their labour and investment, and to provide consumers with a continuous and adequate supply of high-quality dairy products. The Federal Government, through the Canadian Dairy Commission, supports the income of manufacturing milk and cream producers by means of "offer-to-purchase" programs for certain dairy products and direct subsidy payments.

In the 1967-68 dairy support year, the Federal Government introduced a global subsidy eligibility quota which was directly related to the domestic consumption of milk marketed by manufacturing milk and cream shippers. Individual quotas were allocated on the basis of the shipper's deliveries during the previous dairy support year, with certain exceptions. The quota policy, with slight modifications, remained in effect through the dairy support years 1968-69 and 1969-70.

Producer Marketing Boards.—During the 1930s strong support developed for legislation whereby agricultural producers could exercise legal authority under certain conditions to control the marketing of their produce. The Natural Products Marketing Act of 1934 attempted to provide this power at the federal level but proved *ultra vires*. The Natural Products Marketing (British Columbia) Act, 1936 was *intra vires* of provincial government powers and provided the model from which marketing board legislation has evolved in all 10 provinces.

While marketing board legislation has been revised from time to time on the basis of experience and there are variations in detail from province to province, the same basic powers are given to producers in all provinces. These powers include authority for a duly constituted producer board to control the marketing of 100 p.c. of a specified commodity produced in a designated area. A producer board, in at least some provinces, may set production quotas for each farmer. One producer board may control the marketing of several related commodities and the designated area may be either the whole or part of a province. A producer vote is usually required to establish a producer marketing board whose powers are delegated either by a provincial marketing board, which has certain supervisory authority, or by the Lieutenant-Governor in Council.

The powers of a producer marketing board provided by provincial legislation are necessarily limited to intraprovincial trade. Under the Agricultural Products Marketing Act, the Federal Government may delegate to a marketing board with respect to interprovincial and export trade similar powers to those obtained with respect to intraprovincial trade under provincial authority. This Act also gives the Governor in Council the right to authorize a provincial marketing board to impose and collect levies from persons engaged in the production and marketing of commodities controlled by it for the purposes of the board, the creation of reserves and the equalization of returns.

In 1968, there were 119 producer marketing boards operating in Canada, including the Canadian Wheat Board which was established at the federal level. All of the provinces except Newfoundland had one or more boards established under their jurisdictions, with Quebec accounting for 64 and Ontario 22. It is estimated that approximately 46 p.c. of 1968 farm cash income was received from sales made under the control of producer marketing boards. Commodities sold through the boards included wheat, hogs, milk for factory-made dairy products, fruits, potatoes and other vegetables, tobacco, poultry, wool, soybeans, honey, maple products and pulpwood. As at Nov. 1, 1968, 55 of the provincial boards had received an extension of powers for purposes of interprovincial and export trade from the Federal Government; six boards had received authority with regard to ten commodities to collect levies in excess of administrative expenses.

Section 2.—The Department of Consumer and Corporate Affairs

Legislation that received Royal Assent on Dec. 21, 1967 (SC 1967-68, c. 16), transformed the former Department of the Registrar General of Canada into the new Department of Consumer and Corporate Affairs. The duties, powers and functions of the Minister extend to and include all matters over which the Parliament of Canada has jurisdiction, not by law assigned to any other department, branch or agency of the Government of Canada, relating to consumer affairs; corporations and corporate securities; combines, mergers, monopolies and restraint of trade; bankruptcy and insolvency; and patents, copyrights and trade marks.

The Department has three main divisions—the Bureau of Consumer Affairs, the Bureau of Corporate Affairs, and the Office of the Director of Investigation and Research under the Combines Investigation Act. The Bureau of Consumer Affairs co-ordinates government activities in the field of consumer affairs. Branches within the Bureau include Consumer Services, Consumer Research, Operations and Standards. Regional Offices have been established at Halifax, Montreal, Toronto, Winnipeg and Vancouver. Branches of the Bureau of Corporate Affairs include Bankruptcy with Regional Offices in Montreal, Toronto and Vancouver, Corporations, Trade Marks, the Patent and Copyright Office, the Registration Division, and the Corporate Research Branch. Branches under the direction of the Office of the Director of Investigation and Research under the Combines Investigation Act include the Combination Branch, the Merger and Monopoly Branch, the Trade Practices Branch and the Research Branch. The Director also has special investigators in each of the five Regional Offices whose job is investigation of cases of misleading advertising. The Restrictive Trade Practice Commission (Combines Investigation Act) is also domiciled in the Department and reports directly to the Minister.

Branches which serve the Department as a whole are Financial and Administrative Services, Personnel and Information and Public Relations.

Combines, Mergers, Monopolies and Restraint of Trade

The purpose of Canadian anti-combines legislation is to assist in maintaining free and open competition as a prime stimulus to the achievement of maximum production, distribution and employment in a system of free enterprise. To this end, the legislation seeks to eliminate certain practices in restraint of trade that serve to prevent the nation's economic resources from being most effectively used for the advantage of all citizens.

By amendments that came into force on Aug. 10, 1960 (SC 1960, c. 45), all the provisions of the anti-combines legislation which previously had been divided between the Combines Investigation Act (RSC 1952, c. 314) and the Criminal Code were amended and consolidated in the Act. The substantive provisions now are contained in Sects. 2, 32, 33, 33A, 33B, 33C and 34 of the Combines Investigation Act. The Act was enacted in 1923 and was amended extensively in 1935, 1937, 1946, 1949, 1951 and 1952 as well as in 1960. On July 31, 1969, Sect. 306 of the Criminal Code prohibiting false or misleading advertisements was transferred to the Act as Sect. 33D.

Sect. 32, generally speaking, forbids in Subsect. (1) combinations that prevent or lessen "unduly" competition in the production, manufacture, purchase, barter, sale, storage, rental, transportation or supply of an article of trade or commerce or in the price of insurance. Subsect. (1) derives from Sect. 411 of the Criminal Code which was enacted originally in 1889. Although Subsect. (2) provides that no person shall be convicted for participation in an arrangement relating only to such matters as the exchange of statistics or the defining of product standards, etc., Subsect. (3) provides that Subsect. (2) does not apply if the arrangement has lessened or is likely to lessen competition unduly in respect of prices, quantity or quality of production, markets or customers or channels of distribution, or if the arrangement "has restricted or is likely to restrict any person from entering into or expanding a business in a trade or industry". Subsect. (4) provides that, subject to Subsect. (5), no person shall be convicted for participation in an arrangement which relates only to the export trade. Subsect. (5) provides that Subsect. (4) does not apply if the arrangement has had or is likely to have harmful effects on the volume of export trade or on the businesses of Canadian competitors or on domestic consumers.

Sects. 2 and 33 make it an offence to participate in a merger that has or is likely to have the effect of lessening competition to the detriment or against the interest of the public. These Sections also make it an offence to participate in a monopoly that has been operated or is likely to be operated to the detriment or against the interest of the public.

Sect. 33A deals with what are commonly called "price discrimination" and "predatory price cutting". It provides that a supplier may not make a practice of discriminating among those of his trade customers who come into competition with one another by giving one a preferred price which is not available to another if the second is willing to buy in like quantities and qualities as the first; it also forbids a supplier from selling at prices lower in one locality than in another, or unreasonably low anywhere, if the effect or tendency of such policy is to lessen competition substantially or eliminate competitors or the policy is designed to have such effect.

Sect. 33B provides that where a supplier grants advertising or display allowances to competing trade customers he must grant them in proportion to the purchases of such customers; any service he exacts in return must be such that his different types of customers are able to perform; and if such customers are required to incur expenses to earn such allowances, such expenses also must be proportionate to their purchases.

Sect. 33C makes it an offence for any person, for the purpose of promoting the sale or use of an article, to make any materially misleading representation to the public concerning the price at which such or like articles have been, will be or are ordinarily sold.

Sect. 33D makes it an offence to publish an advertisement containing a statement that purports to be a statement of fact but is untrue, deceptive or misleading or is intentionally so worded or arranged that it is deceptive or misleading if the advertisement is published to promote a business or commercial interest or the sale or disposal of property.

Sect. 34 prohibits a supplier of goods from prescribing the prices at which they are to be resold by wholesalers or retailers or from cutting off supplies to a merchant because of the merchant's failure or refusal to abide by such prices, i.e., the practice of "resale price maintenance". The Section also provides that it shall not be inferred that a person practised resale price maintenance simply because he refused or counselled the refusal of supplies to a merchant if there were reasonable cause to believe and the supplier did believe that the merchant was making a practice of using articles of such supplier as "loss-

leaders" or as bait advertising or was making a practice of engaging in misleading advertising in respect of such articles or of not providing services that purchasers of such articles might reasonably expect.

The Director of Investigation and Research is responsible for investigating combines and other restrictive practices, and the Restrictive Trade Practices Commission is responsible for appraising the evidence submitted to it by the Director and the parties under investigation, and for making a report to the Minister of Consumer and Corporate Affairs. When there are reasonable grounds for believing that a forbidden practice is engaged in, the Director may obtain from the Commission authorization to examine witnesses, search premises, or require written returns. After examining all the information available, if the Director believes that it proves the existence of a forbidden practice, he submits a statement of the evidence to the Commission and to the parties believed to be responsible for the practice. The Commission then sets a time and place at which it hears argument on behalf of the Director in support of his statement, and hears argument and receives evidence on behalf of any persons against whom allegations have been made in the statement. Following this hearing, the Commission prepares and submits a report to the Minister of Consumer and Corporate Affairs, ordinarily required to be published within thirty days.

Under the provisions of the Act, general inquiries may be made into restraints of trade which, although not forbidden or punishable, may affect the public interest. The courts, including the Exchequer Court of Canada,* in addition to imposing punishment for a contravention of the legislation, may make an order restraining persons from embarking on, continuing or repeating a contravention or directing the dissolution of a merger or monopoly as the case may be. Application also may be made to the courts for such an order in lieu of prosecuting and convicting for a contravention of the legislation. Prosecutions for offences against the substantive provisions of the legislation (other than Sect. 33C which is punishable only on summary conviction) may be taken either in the provincial courts or with the consent of the accused in the Exchequer Court of Canada.*

In July 1969, following a reference by the Government, the Economic Council of Canada submitted its Interim Report on Competition Policy which recommended substantial changes in the Combines Investigation Act. The recommendations are under study before revisions to the Act are introduced to Parliament.

In the period Jan. 1, 1967, to June 30, 1970, the following reports of inquiries under the legislation were published:—

- (1) "Specials" in Eggs, Kingston Area, Ont.
- (2) Glued-Laminated Timbers.
- (3) Cast Iron Soil Pipe.
- (4) Resale Prices of Corning Glassware.
- (5) Dairy Products, Montreal.
- (6) Resilient Flooring, Toronto.
- (7) Prices of Gasoline, Sudbury.
- (8) Road Paving in Ontario.
- (9) Business Forms.
- (10) Business Forms, Quebec.

These reports and copies of the annual reports under the Act may be obtained from Information Canada or the office of the Director of Investigation and Research, Combines Investigation Act, Department of Consumer and Corporate Affairs, Ottawa.

Patents

Letters patent are issued subject to the provisions of the Patent Act (RSC 1952, c. 203, as amended) and Patent Regulations have been proclaimed to carry into effect the objects of the Act. By an amendment that came into effect on July 1, 1969, an abstract of the disclosure of the application is required with each application for patent; by an amend-

* Now the Federal Court of Canada.

ment effective June 27, 1969, Rules were added dealing with applications for licence under Sect. 41 of the Act; and by an amendment effective Oct. 1, 1969, all fees previously found in Sect. 75(1) of the Act and Schedules B and C of the Rules were consolidated into a new Schedule B of the Rule, and certain fees were changed. Applications for patents and requests for information about patents should be addressed to the Commissioner of Patents, Ottawa.

The number of patents granted each year has increased steadily from 4,522 at the beginning of the century to 28,981 in the year ended Mar. 31, 1970. Approximately 5.0 p.c. of the patents granted resulted from inventions made by residents of Canada, 7.5 p.c. by residents of Britain and other Commonwealth countries and 66.0 p.c. by residents of the United States.

Printed copies of Canadian patents issued from Jan. 1, 1948 to date are available at a nominal fee. The *Patent Office Record*, published every week, contains an abstract of each patent, information about the services available in the Patent Office, and information for the patent profession.

Canadian and foreign patents may be consulted at the Patent Office Library. British patents and abridged specifications thereof from 1617 to date and United States patents from 1845 to date are available, as well as many patents, indexes, journals and reports from Australia, India, Ireland, New Zealand, Pakistan, South Africa, Austria, Belgium, Colombia, Czechoslovakia, Egypt, France, Germany, Italy, Japan, Mexico, the Netherlands, Norway, Sweden, Switzerland and Yugoslavia. A list of the foreign patents available is published in the *Patent Office Record*.

Copyrights, Industrial Designs and Timber Marks

Copyright protection is governed by the Copyright Act (RSC 1952, c. 55) in force since 1924. Protection is automatic without any formality, although a system of voluntary registration is provided. Application for registration should be addressed to the Commissioner of Patents, Ottawa.

The Act sets out the qualifications for a copyright and its duration: "Copyrights shall subsist in Canada . . . in every original literary, dramatic, musical and artistic work, if the author was, at the date of the making of the work, a British subject, a citizen or subject of a foreign country which has adhered to the Berne Convention and the additional Protocol . . . or resident within Her Majesty's Dominions. The term for which the copyright shall subsist shall, except as otherwise expressly provided by this Act, be the life of the author and a period of fifty years after his death."

Canada belongs to the Universal Copyright Convention. This means that the works of Canadian authors are protected in the United States without formality of compulsory registration or the obligation of printing in the United States, provided that, from the first publication, the work bears in a prominent place the following identification: ©, followed by the name of the proprietor and the year of publication.

Copyright protection is extended to records, perforated rolls, cinematographic films, and other contrivances by means of which a work may be mechanically performed. The intention of the Act is to enable Canadian authors to obtain full copyright protection in Canada, in all parts of the Commonwealth, in foreign countries of the Copyright Union and in the United States. Protection of industrial designs and of timber marks is afforded under the Industrial Design and Union Label Act and the Timber Marking Act. Registers of such designs and marks are kept by the Copyright Branch of the Patent Office.

Trade Marks

The Trade Marks Office, a Branch of the Consumer and Corporate Affairs Department, administers the Trade Marks Act (SC 1952-53, c. 49) which covers all legislation concerning the registration and use of trade marks and supersedes from July 1, 1954, former legislation enacted under the Unfair Competition Act, the Union Label Act and the Shop Cards Registration Act. Correspondence relating to an application for registration of a trade mark should be addressed to the Registrar of Trade Marks, Ottawa.

Applications are advertised for opposition purposes in the *Trade Marks Journal*, a weekly publication that also gives particulars of every registration of a trade mark and every registration of a registered user. The required fee payable on application for registration of a trade mark is \$35, for advertisement of an application \$25 and for registration of a person as a registered user of a trade mark, \$35.

Section 3. - Control and Sale of Alcoholic Beverages

The retail sale of alcoholic beverages in Canada is controlled by provincial and territorial government liquor control authorities. Alcoholic beverages are sold directly by most of these liquor control authorities to the consumer or to licensees for resale. However, in some provinces beer and wine are sold directly by breweries and wineries to consumers or to licensees for resale. During the year ended Mar. 31, 1969, provincial government liquor authorities operated 1,208 retail stores and had 197 agencies in smaller centres of population.

Government revenue specifically related to alcoholic beverages and details of sales by value and volume for each province are given below. DBS report, *The Control and Sale of Alcoholic Beverages in Canada* (Catalogue No. 63-202) shows further detail as well as

volume figures of production and warehousing transactions, the value and volume of imports and exports and the assets and liabilities of provincial liquor commissions.

4.—Revenue of Provincial and Territorial Governments Derived Specifically from the Control and Sale of Alcoholic Beverages, Years Ended Mar. 31, 1968 and 1969

NOTE.—Figures include revenue collected directly by the provincial and territorial governments as well as revenue of the liquor authorities, but exclude revenue resulting from general retail sales taxation with the exception of the 1969 figures for Quebec, which include \$10,140,000 in sales tax collected at outlets.

Section 4.—Miscellaneous Aids or Controls

The National Energy Board

The National Energy Board was established under authority of the National Energy Board Act, 1959 (SC 1959, c. 46), for the broad purpose of assuring the best use of energy resources in Canada. The Board is responsible for adjudicating upon applications for licences to export and to import natural gas, applications to construct and operate inter-provincial and international pipelines for the transportation of petroleum and its products and of natural gas, and applications for licences to export electric power and energy, and for certificates to construct and operate international power lines. It is responsible for regulating the rates, tolls and tariffs of oil and gas pipelines under its jurisdiction, a field in which it is becoming increasingly active. The Board reports to Parliament through the Minister of Energy, Mines and Resources.

In addition to its regulatory responsibilities, the Board has an advisory role. In this capacity it is required to keep under review all matters relating to energy within the jurisdiction of the Parliament of Canada and to recommend to the Minister any measures that the Board considers necessary or advisable to undertake in the public interest to ensure proper use and development of energy and its sources.

In early 1970 the National Energy Board Act was amended, bestowing on the Board certain additional responsibilities. The Board was given jurisdiction over international power lines constructed and operated for the purpose of importing power into Canada on a basis comparable to the jurisdiction it had exercised previously over export power lines only. The existing authority of the National Energy Board to license the import of gas was extended to include the licensing for import of liquefied natural gas. Certain other amendments dealing with the construction of pipelines through municipal and private farm areas provided the Board with the authority to direct the pipeline company to divert, relocate or otherwise reconstruct the appropriate portions of its pipeline so as to remove an existing interference or impairment or to otherwise facilitate reconstruction or relocation of drainage systems. In addition, because of the increase in the Board's workload arising out of its existing regulatory and advisory functions, the membership of the National Energy Board was increased from five to seven.

Also in 1970, as a result of certain regulations made under Part IV of the National Energy Board Act, the Board is responsible for the licensing of the importation into Canada of motor gasoline or motor gasoline blending components.

The Board is also charged with the administration of the federal Oil Policy, which had as its initial short-term aim the attainment of higher production targets for oil, including natural gas liquids. The basic intent of this policy has not changed.

The National Power Policy, announced in 1963, encourages the development of large-scale power sources at lowest possible cost; the distribution of the benefits thereof as widely as possible through interconnections between power systems within Canada; and the long-term export of large blocks of power where such exports will induce early development of Canadian power resources. This policy also encourages the export of various classes of power under suitable interconnection agreements to provide for mutual assistance in emergencies and for other economic benefits that can be derived by both parties through co-ordinated operation and development. In pursuance of these aims, the Board co-operates with other agencies in the consideration of interprovincial and international interconnections of electric power systems. In this context it is worthy of note that now almost all electrical utilities in Canada and the United States are interconnected with neighbouring systems and are operating as part of one vast power network.

The Board is empowered to regulate the tolls charged by oil and gas pipeline companies, subject to its jurisdiction to ensure that such tolls are just and reasonable. To date, this power has not been invoked but, in anticipation of the commencement of formal rate hearings, the Board has ordered into force Part IV of the National Energy Board Act which concerns such matters.

The unique characteristics of regulated enterprises, of which pipelines form a part, necessitate specialized accounting procedures to enable the Board to create uniform standards for the measurement and control of financial and rate matters. Accordingly, Uniform Accounting Regulations are a prerequisite to any systematic regulation of rates, tolls and tariffs and provide the means by which financial information can be compared. Regular audits and investigations are conducted of pipeline companies' accounting records to ensure that Board regulations are followed and to extract essential financial information that is not disclosed in periodic financial statements. In carrying out its statutory responsibilities, the Board must be satisfied that the rates of a company under its jurisdiction are just and reasonable and, in addition, that a pipeline's revenues will provide a fair rate of return on its capital.

The Board conducts continuing studies of energy matters in order to maintain a bank of current knowledge which is necessary for the Board to perform its regulatory and advisory functions. Energy supply and demand forecasts are a continuing function of the Board's work. Studies include both the Canadian and foreign markets since fuels and, to a more limited extent, electric power are traded internationally.

During 1969, a long-term energy forecast produced by the Board's staff was published entitled *Energy Supply and Demand in Canada and Export Demand for Canadian Energy—1966 to 1990*. Copies are available from Information Canada.

The Standards Council of Canada

The Standards Council of Canada was established by Act of Parliament (SC 1969-70, c. 73), which received Royal Assent on Oct. 7, 1970. The Council will act as a national co-ordinating institution through which organizations concerned with voluntary standardization may co-operate in recognizing, establishing and improving standards in Canada and develop a broader and more energetic Canadian standards program to meet both national and international responsibilities. Its structure is intentionally designed to make maximum use of those organizations already in existence and functioning efficiently. The aim is to broaden the range of activities and to co-ordinate them in order to obtain a more complete coverage of standards needs.

The objects of the Council are to foster and promote voluntary standardization in fields relating to the construction, manufacture, production, quality, performance and safety of buildings, structures, manufactured articles and products and other goods, including components thereof, not expressly provided for by law, as a means of advancing

the national economy, benefiting the health, safety and welfare of the public, assisting and protecting consumers, facilitating domestic and international trade and furthering international co-operation in the field of standards. It will be responsible in the private sector for encouraging preparations for change to the metric system in a manner to achieve optimum benefits at minimum cost and will ensure that, in the process of rewriting standards to metric terms, there will be an opportunity to update the standards themselves where appropriate.

The Council will consist of not more than 57 members, headed by a president and a vice-president. The seats of the Council, other than the 16 assigned to government representatives (six federal and ten provincial), will be occupied by representatives of national organizations. Membership will be broadly representative of all levels of government (federal, provincial and municipal), primary and secondary industries, distributive and service industries, trade associations, labour unions, provincial associations, consumer associations and the academic community.

Trade Standards and Regulations

In its consumer program, the Department of Consumer and Corporate Affairs is responsible for the administration of broad legislation which affects the business community. Policies and programming are determined by the Standards Branch, and the necessary field supervision by the Operations Branch.

Hazardous Products.—General regulations issued under the Hazardous Products Act provide for the banning or the regulated sale of a variety of dangerous products which are toxic, flammable, explosive, or corrosive. These relate largely to household products. Toy Regulations are directed to eliminating dangerous toys.

General Commodity Field.—The National Trade Mark and True Labelling Act provides a framework for the development of National Standards and true labelling in order to prevent deception in labelling and advertising. The Garment Sizing Regulations were developed as a National Standard for sizing of childrens' garments. The labelling provision has been used for regulation for fur garments, watch jewels, textiles, etc. Textiles will be subject to special new requirements which are being established under a new Textile Products Act. (See p. 1345.)

Control of marking of precious metal articles is maintained under the Precious Metals Marking Act. This Act will shortly be replaced by a revised statute passed by Parliament.

In the packaging and labelling field, a Packaging and Labelling Bill is before Parliament for consideration (December 1970). This is umbrella legislation to give uniformity to packaging practices in Canada, to reduce packaging and advertising deception, and to control proliferation.

Food.—In areas of health, grading, standards and composition, the Food and Drug Act, the Canadian Agricultural Products Standards Act and the Fish Inspection Act are generally applicable. The Consumer and Corporate Affairs Department is charged with administration of the economic fraud aspects in distribution. This area is concerned mainly with labelling, and advertisement in any segment of the news media.

Advertising.—Most legislation has particular requirements to ensure against misleading advertising. Notice should be taken of Sections 33(c) and (d) of the Combines Investigation Act administered in the Corporate activity of the Department; these include general provisions against misleading advertising practices.

Measurement.—The Weights and Measures Act prescribes the legal standards of weight and measure for use in Canada; it also requires control of the type of all weighing and measuring devices used for commercial purposes and their periodic verification and surveillance directed toward the elimination of sales by short weight or short measure. A

replacing Bill is at present (December 1970) before Parliament. The fundamental objectives of existing legislation are unchanged. The new Bill is an updating, and complements the proposed packaging and labelling legislation.

The Electricity Inspection Act and the Gas Inspection Act control the approval before sale and use of devices used for the sale of electricity and gas. It also provides a framework for continual in-use inspection.

Government Financial Assistance for Coal*

The Canadian coal mining industry is faced with the problem that the producing mines are not located near the main consuming markets in Ontario and Quebec, which markets lie in close proximity to the more economic United States coals. Transportation subventions, which have been maintained in varying degrees since 1927, were designed to further the movement of Canadian coals by equalizing as far as possible the laid-down costs of imported coals in various market areas and, since 1962, the laid-down costs of imported residual oil in the Atlantic Provinces and Quebec. From inception in 1927 to Mar. 31, 1969, \$320,999,665 was paid in subvention aid by the Federal Government.

As a result of federal-provincial agreements and the establishment of the Cape Breton Development Corporation in Nova Scotia and the Grand Lake Development Corporation in New Brunswick, subvention aid was discontinued in 1968 in Eastern Canada. In Western Canada, authority for paying subventions expired on Mar. 31, 1970, with the exception that a one-year extension (to Mar. 31, 1971) was continued with respect to aid on two export contracts with Japan.

As a result of these changes, subvention payments were reduced from \$12,800,000 in 1968 to \$3,500,000 in 1969. Of the latter figure, \$3,200,000 was used to assist British Columbia and Alberta mines exporting coal to Japan and \$250,000 was used to move British Columbia, Alberta and Saskatchewan coals to Ontario. Consequently, after Mar. 31, 1971, subvention payments will cease entirely.

Although the Canadian Coal Equality Act (RSC 1952, c. 34), which implemented one of the recommendations of the Royal Commission on Maritime Claims (1926), was designed to assist the Canadian steel industry, it also was of benefit to the Canadian coal industry, particularly in Eastern Canada. It provided for the payment of 49.5 cents per ton of bituminous coal mined in Canada and converted into coke to be used in the Canadian manufacture of iron and steel. Payments by the Dominion Coal Board under the Canadian Coal Equality Act ended on Mar. 31, 1968, and the Act was withdrawn on May 1, 1970 by proclamation of the Governor in Council. Payments were made on 54,768 tons in the amount of \$27,108 during January, February and March 1968. Shipments to which these payments applied were made during the latter part of November 1967 through March 1968.

PART III.—BANKRUPTCIES AND COMMERCIAL FAILURES

Two series of figures are included in this Part which, although closely related as far as subject matter is concerned, cover different aspects of the field of bankruptcies and commercial failures. The first, under the heading of "Administration of Bankrupt Estates" is limited to the supervision, by the Superintendent of Bankruptcy, of the administration of bankrupt estates under the Bankruptcy Act (including the Farmers' Creditors Arrangement Act): it gives information on the amounts realized from the assets as established by debtors and indicates that values actually paid to creditors are invariably very much lower than such estimates alone would imply. It can therefore be assumed that this applies in even greater degree to the more extended fields covered in the second section under the heading of "Returns under the Bankruptcy and Winding-Up Act" which is compiled by the Dominion Bureau of Statistics. This series is limited to bankruptcies and insolvencies made under federal legislation and includes business failures only (see p. 1053).

* Prepared by the Mines Branch, Department of Energy, Mines and Resources, Ottawa.

Administration of Bankrupt Estates.*—The Bankruptcy Act, which was last revised in 1949, was amended by SC 1966, c. 32. These amendments were instigated by exposures and suggestions of illegal and improper practices in connection with bankruptcy proceedings or administration. They do not constitute a complete revision of the Bankruptcy Act but were designed rather to provide, as an interim measure, remedies to the most urgent areas of complaints. They provide the Superintendent of Bankruptcy with direct and immediate authority in the field of investigation and inquiry, and tighten the procedures and requirements in a number of areas, such as that of proposals which an insolvent person may make to his creditors. In other words, these amendments were intended to provide remedies in situations where it had been shown by experience that abuses of the bankruptcy process are most likely to occur. The amendments also contain a new Part X entitled "The Orderly Payment of Debts" which may come into force in any province at the request of the provincial authorities concerned. This Part came into force in Alberta on Apr. 17, 1967, and in Manitoba on June 1, 1967.

A report issued annually by the Superintendent of Bankruptcy gives statistics and comments on various activities in the field of bankruptcy, such as prosecution for offences, issue of licences for trustees in bankruptcy, number of estates reported and closed during the year, and costs of bankruptcy administration in Canada.

* Revised by the Superintendent of Bankruptcy, Ottawa.

PART IV.—PRICES*

Price statistics primarily take the form of indexes which express prices in each period as a percentage of prices in a designated base period. The indexes measure the movement of prices from period to period. Another less frequent type of price index expresses prices in one location as a percentage of prices in a base location, which is set equal to 100, and measures the comparative levels of prices between places (Table 13) at a point in time. In addition to indexes, price statistics may take the form of price averages (Table 10). Price averages reflect the structure of prices at a given period of time.

Summary tables of available price statistics are presented herein relating to general wholesale prices, prices of capital goods and construction, consumer prices, and prices of

* Prepared in the Prices Division, Dominion Bureau of Statistics.

common and preferred stocks. In addition, statistics on patterns of family expenditure, by income group, are provided in Section 5. For further details, including indexes of selling prices of each of some 100 Canadian manufacturing industries, the reader is advised to consult the monthly DBS publication *Prices and Price Indexes* (Catalogue No. 62-002). In addition, price indexes relating to merchandise exports and imports (Chap. XXII) are published monthly in Catalogue No. 65-004 and No. 65-007, respectively. Similarly, implicit price indexes for gross national product and its main components (Chap. XXIV) are published quarterly in Catalogue No. 13-001.

Section 1.—Index Numbers of Wholesale Prices

The term "wholesale prices" refers to transactions that occur below the retail level. It has more of a connotation of bulk purchase and sale than of any homogeneous level of distribution. Wholesale price indexes and individual price series have numerous uses, one of the most important of which is in escalator clauses of contracts where prices quoted are linked to movements of specified price indexes. They are also of major importance in studies of replacement and construction costs in investment projects; analyses of price movements of both individual items and commodity groups in relation to purchases and sales; industrial planning and market analysis; valuations for tax purposes and inventory analysis; and studies of changes in physical volume. Foreign companies also utilize the indexes in assessing the competitive position of Canadian goods.

General Wholesale Index.—The general wholesale index mainly includes manufacturers' prices but also incorporates those of wholesalers proper, assemblers of primary products, agents and operators of other types of commercial enterprises which trade in commodities of a type, or in quantities characteristic of primary marketing functions. Prices are grouped according to a commodity classification scheme based on chief component material similarities. Indexes classified according to degree of manufacture are also available. In Table 1, the general wholesale index is presented for the period 1946-69. This index is used as a conventional summary figure against which to observe the behaviour of particular price groups such as farm products, raw materials and building materials, for which separate price indexes have been constructed. Table 2 gives, for the years 1960-69, the general wholesale price index and two of its integral classifications—raw and partly manufactured goods, and fully and chiefly manufactured goods; also presented are two related systems—industrial materials and Canadian farm products.

1.—General Wholesale Index Annual Averages, 1946-69

The "Economic White Paper" tabled in the House of Commons on Mar. 12, 1970, stated that inflation was the most pressing economic problem in 1969. Throughout the year, demand had fluctuated around a high level while monetary and fiscal policies had been directed toward restraint. The year was marked by a notable acceleration in the rate of price increase, as measured by the general wholesale price index. For example, this index rose by 4.3 p.c. through the year in contrast to an increase of 2.8 p.c. a year earlier. The gross weighted index of industry selling prices displayed a similar pattern, having increased by 4.2 p.c. between December 1968 and December 1969 and by 2.3 p.c. in the earlier 12-month period ended December 1968.

Major groups of the general wholesale price index showed diverse movements during 1969. Non-ferrous metals rose 18 p.c., while chemical products increased by 4 p.c., non-metallic minerals 2 p.c., animal products 8 p.c. and iron products 7 p.c. Wood products prices, influenced by the trend in housing starts, reached a peak in March 1969 after climbing steeply but declined for the remainder of the year so that, on balance, there was only a fractional increase. Vegetable products also increased fractionally but textile products showed a slight decline.

World Wholesale Price Indexes.—Price changes within different countries have varied widely during the years. Comparisons of Canadian wholesale price indexes with those of other countries are given in Table 3.

Section 2. —Price Index Numbers of Construction and Capital Goods

This Section covers price indexes currently available for residential, non-residential building, and engineering construction. Further details concerning these series or developments under way in other areas are available from the Prices Division of DBS.

Residential and Non-residential Building Construction Indexes.—Two series of indexes are produced by DBS measuring price changes for residential and non-residential building construction. These are base-weighted indexes of materials and labour, and are presented in Table 4 for the years 1956-69 (figures from 1935 are available in the May 1970 issue of *Prices and Price Indexes*).

The building materials price indexes are drawn from the system of industry selling price indexes (*Industry Selling Price Indexes 1956-1968*, Catalogue No. 62-528) and relate to a selection of building materials derived from a sample of buildings surveyed after the Second World War. Some modifications have since been introduced into the series (described in *Prices and Price Indexes* for March 1969 and May 1970) and the federal sales tax has been added to the materials indexes as appropriate. The wage rate component is derived from surveys conducted by the Department of Labour for construction trades in various centres; these are base rates and usually reflect union scale or collective agreements. The combined indexes of materials and wage rates do not reflect changes in profit margins or in productivity; implicit price indexes from gross fixed capital formation reflecting these factors are available from the National Income and Expenditure Division of DBS.

4.—Price Indexes of Residential and Non-residential Building Materials and Wage Rates, 1956-69

(1961=100)

NOTE.—Figures from 1935 are available in the May 1970 issue of *Prices and Price Indexes*.

Year	Price Indexes of Building Materials		Construction Wage Rates	Composite Indexes of Materials and Wage Rates	
	Residential	Non-residential		Residential	Non-residential
1956	100.1	97.7	75.4	88.2	87.6
1957	100.1	99.2	79.9	90.4	90.6
1958	99.2	99.0	85.7	92.7	93.0
1959	101.3	100.5	91.1	96.4	96.3

1964	109.5	106.6	113.1	111.2	109.5
1965	115.8	111.5	118.6	117.1	114.7
1966	120.5	115.4	128.1	124.2	121.1
1967	125.3	117.8	140.8	132.8	128.2
1968	132.1	120.7	152.8	142.0	135.1
1969	139.2	126.1	164.5	151.4	143.3

Highway Construction Indexes.—The price indexes of highway construction in Canada express prices paid by provincial governments each year in contracts awarded for highway construction as a percentage of price paid in 1961. The base-weighted indexes measure the effect of price change on the cost of specified programs of new highway construction represented by contracts of approximately \$50,000 or more awarded by provincial governments.

The all-items indexes and their components are useful in planning and budgeting for highway construction programs, in updating previously costed projects, in estimating

replacement cost of previously completed road work and in measuring historical price trends. Prices contained in the index are for units of construction work put in place, such as a cubic yard of earth excavation or a ton of bituminous hot-mix paving. Also included are prices of some materials, such as culvert pipe, usually supplied to the contractor by the highways department. (*Prices and Price Indexes* for December 1967 contains details of the problems of estimating price change for highway construction.)

¹ Direct comparisons should not be made between this index and the highway index published by the Ontario Department of Highways; the item content is substantially different.

Electrical Utility Construction Indexes.—The price indexes of electrical utility construction, which include those of distribution systems, transmission lines and transformer stations, give some idea of the impact of price change on the cost of materials, labour and equipment used in constructing and equipping electrical utilities in a specified base period. The index provides an estimate of how much more, or less, it would cost to reproduce the base-period program of construction in another period, using the same construction technology as in the base period and assuming rates of profit and productivity in construction are the same in both periods.

Major uses of the index relate to the estimation of reproduction costs or the deflation of capital formation. Fixed-weighted national input indexes have deficiencies for this purpose which may be alleviated by the use of detailed deflation techniques and through the utilization of specifically appropriate productivity adjustments. (These problems are discussed in DBS Occasional Paper *Price Indexes of Electric Utility Construction*, Catalogue No. 62-526.)

Prices used in the indexes are, for the most part, selling prices reported monthly by manufacturers for materials or equipment. The price reported is for units and terms of sale representative of the volume sales of the manufacturer. Federal sales tax changes are reflected in the index but no adjustments have been made for provincial tax changes. Until December 1964, wage rate data were supplied by the Department of Labour and represented minimum hourly rates paid to construction workers in major cities employed on Federal Government contracts. In 1965, union basic wage rates reported by major utilities and some contractors were incorporated into the index. The sample selected provides an estimate of wage rate change for urban own-account and contract electrical utility construction.

Section 3.—Consumer Price Index*

The purpose of the consumer price index is to measure the movement from month to month in retail prices of goods and services bought by a representative cross-section of the Canadian urban population. For a particular article or service, a price index number is simply the price of the article in one period of time expressed as a percentage of its price in a reference period, usually called a base period. However, indexes for individual goods may be combined to form indexes representing prices of broad groups of goods and services. Thus, the consumer price index relates to the wide range of goods and services bought by Canadian urban families. The index expresses the combined prices of such goods each month as a percentage of their prices in the base period 1961.

The group of goods and services represented in the index is called the index "basket" and "weights" are assigned to the price indexes of individual items for purposes of com-

* A comprehensive description of the index is contained in the publication *The Consumer Price Index (1949=100)*—Revision Based on 1957 Expenditures (Catalogue No. 62-518). A description of the change in the base period from 1949 to 1961 appears in the January 1969 issue of *Prices and Price Indexes* (Catalogue No. 62-002).

binning them into an over-all or composite index. The weights reflect the relative importance of items in expenditures of middle-size urban families with medium incomes. The basket is an unchanging or equivalent quantity and quality of goods and services. Only prices change from month to month and the index, therefore, measures the effect of changing prices on the cost of purchasing the fixed basket. The basket and weights now used in the index are based on expenditures in 1957 of families of two to six persons, with annual incomes of \$2,500 to \$7,000, living in cities of 30,000 population or over.

8.—Consumer Price Index Numbers, 1946-69

(1961=100)

1951.....	88.0	1957.....	94.3	1963.....	103.0	1969.....	125.5

The behaviour of the consumer price index during the years of almost continuous economic growth following the end of the Second World War up to 1959 is discussed in the 1962 Year Book at pp. 928-929, and the movement during 1959-68 in subsequent editions. Between 1968 and 1969, the annual consumer price index rose 4.5 p.c., marking the largest annual increase since the Korean War. In the five-year period ended 1969, the annual index advanced 19.8 p.c., which represented a drop of 16.5 cents in the purchasing power of the consumer dollar.

The 4.5-p.c. rise in the index between 1968 and 1969 compares with an average increase of 3.7 p.c. over the period 1964-69. Since 1964, the average annual increase of the two most important components—food and housing—paralleled closely the advance in the all-items index by rising, on average, 3.6 and 3.7 p.c., respectively. The other major components registered five-year average increases of from 3.3 p.c. for clothing to 4.4 p.c. for health and personal care.

9.—Consumer Price Indexes for Specific Groups, 1960-69

(1961=100)

Year	Food	Housing	Clothing	Transportation	Health and Personal Care	Recreation and Reading	Tobacco and Alcohol	Composite Index
GROUP WEIGHT AS A PERCENTAGE OF TOTAL.....	27	32	11	12	7	5	6	100
1960.....	98.5	99.6	98.6	99.8	99.5	98.8	99.6	99.1

1962.....	101.8	101.2	100.9	99.9	102.0	100.8	101.3	101.2
1963.....	105.1	102.3	103.4	99.9	104.6	102.2	101.5	103.0
1964.....	106.8	103.9	106.0	101.0	108.0	103.9	103.4	104.8
1965.....	109.6	105.8	107.9	104.8	113.0	105.6	105.1	107.4
1966.....	116.6	108.7	112.0	107.3	116.5	108.6	107.6	111.4
1967.....	118.1	113.4	117.6	111.8	122.5	114.1	110.4	115.4
1968.....	122.0	118.6	121.1	114.7	127.4	119.7	120.4	120.1
1969.....	127.1	124.7	124.5	120.0	133.6	126.8	125.0	125.5

Between 1968 and 1969, annual average food prices rose 4.2 p.c., food at home increasing 4.0 p.c. and restaurant meals 6.8 p.c. The housing index advanced 5.1 p.c. over the same period, which was the largest of five progressive increases made by this component

since 1964. Clothing, on the other hand, after registering a peak rate of increase of 5.0 p.c. between 1966 and 1967, showed an annual rise of 3.0 p.c. in the subsequent years; its advance of 2.8 p.c. between 1968 and 1969 was the smallest among the major components. The recreation and reading index advanced 5.9 p.c. between 1968 and 1969, which was the highest rate of increase among the major components; health and personal care prices increased 4.9 p.c., transportation prices 4.6 p.c., and average tobacco and alcohol prices 3.8 p.c.

Table 10 gives single-commodity price relatives for a number of important items entering into the food component of the consumer price index.

Table 11 presents regional consumer price indexes for ten cities or city combinations. These indexes do not show whether it costs more or less to live in one city than in another and should not be used for such comparisons. Their function is to measure percentage changes in retail prices—over a certain time in each city or city combination—of a fixed basket of goods and services representing the level of consumption of a particular group of families. Indexes which compare price levels among major Canadian cities are shown on p. 1063.

World Retail Price Indexes.—In order to place movements in Canadian retail prices into perspective, they should be compared with price changes occurring elsewhere in the world. This is done in Table 12, which indicates the percentage changes over the previous year in the consumer price index for each country specified. For purposes of comparison, countries are listed, alphabetically, by region. It should be noted that all percentages are rounded to the nearest whole number.

Section 4.—Intercity Retail Price Differentials*

As noted on p. 1061, the regional city price indexes given in Table 11 measure the *movements* of consumer prices from month to month *within each city* and cannot be used to compare levels of prices between cities. Indexes that do compare levels of prices among 11

* A fuller explanation of the study from which these indexes were derived, including more details of the price comparisons, is given in the November 1969 issue of *Prices and Price Indexes*.

major Canadian cities are given in Table 13. These indexes express prices in each city as a percentage of prices in Winnipeg at May 1969, with Winnipeg prices at that date set equal to 100. The selection of Winnipeg as the base city has no special significance; the indexes may be expressed on the base of any of the individual cities included. The selected commodity groupings shown make up about three quarters of the average urban consumer budget, the most important omissions, for technical reasons, being shelter (rented and owned), fuel, light and water, and restaurant meals.

The retail prices from which the indexes were derived are largely those collected in each city for production of the consumer price index. Comparability between cities was achieved by matching, as far as possible, quotations for similar qualities of goods and services and types of retail outlets. Since prices compared include sales and excise taxes as applicable, variations between provinces in the scale of sales taxes imposed on a wide range of non-food commodities can be of significance in explaining intercity price differentials for these items.

13.—Intercity Indexes of Retail Price Differentials for Selected Groupings of Commodities and Services, as at May 1969

Section 5.—Consumer Expenditure

Household surveys of family expenditure provide information on consumer spending that can be related to family characteristics, such as geographical location, family size, income level, etc. A primary purpose of such surveys is to provide information for constructing, reviewing and revising the weights of consumer price indexes. Initially, the small-scale sample surveys carried out in Canadian urban centres since 1953 were designed to follow changes in the spending patterns of a well-defined group of middle-income urban families known as the target group of the consumer price index. However, in the years from 1953 to 1968, during which seven survey programs were conducted, a growing demand for expenditure statistics to serve other needs of government, business, welfare organizations and academic research resulted in a widening in the scope and size of the surveys in recent years, and in a decision to expand the 1969-70 survey programs to provide a large-scale national survey for the first time since 1948-49.

The more restricted surveys (1953, 1955, 1957 and 1962) consisted of two phases—the collection by means of monthly record-keeping surveys throughout the reference year of detailed information on food expenditures, and the collection of information by annual recall of all family expenditure, income and change in assets and liabilities. In the other three surveys (1959, 1964 and 1967), the monthly surveys were omitted and the annual recall surveys were enlarged in scope to refer to all families and individuals, regardless of family type or income. The sample size was doubled in order to obtain about 2,000 usable annual records. The 1959 survey was unique in the series in that it was designed to represent population in all urban centres of 15,000 or over, whereas the 1964 and 1967 surveys were identical in city coverage, referring to 11 major regional cities.

Detailed results of the surveys have been published in two series of occasional publications covering food expenditure and all family expenditure, respectively: *Urban Family Food Expenditure 1962* (Catalogue No. 62-524), *Urban Family Expenditure 1962* (Catalogue No. 62-525), *Urban Family Expenditure 1964* (Catalogue No. 62-527), and *Urban Family Expenditure 1967* (Catalogue No. 62-530).

The family expenditure survey program undertaken for 1969 was national in scope, with considerably larger samples than previously. In monthly surveys throughout 1969, approximately 10,000 families and individuals kept detailed records of expenditures on food and selected non-food items, including quantities acquired. Early in 1970, the same time period was covered in an annual recall survey of all family expenditures and income. About 17,000 family records were obtained which are expected to yield at least 15,000 usable schedules. Both surveys will produce information for small urban, rural non-farm and farm populations as well as for the urban population and individual urban centres. Initial results are expected from the food expenditure survey in late 1970 and from the complete expenditure survey in late 1971.

Table 14 presents a summary of family expenditure patterns in 11 Canadian cities in 1967, classified by family income for families of two or more.

Camping is a pleasant and economical way to spend a summer holiday and therefore one of the most popular forms of family recreation in Canada. The average expenditure of a family on recreation, regardless of size of income and number of persons, is estimated at a little over \$300 a year.

Section 6.—Security Price Indexes

Security price indexes measure, through time, the effect of price change on the value of a portfolio of stocks bought and held by a hypothetical investor (as opposed to the more speculative trader). The portfolio represents stocks of Canadian companies listed on the Toronto, Montreal and Canadian stock exchanges. In the case of the mining index, eligible issues are for producing mines only. The number of shares held for each issue is in proportion to the total number of shares outstanding. Prices in the common stock indexes (investors and mining indexes) are Thursday's closing quotations each week, averaged over weeks. For the monthly preferred stock indexes, prices are monthly weighted averages of the daily closing prices in which weights are daily total sales. The indexes express current prices as a percentage of prices in 1961. Monthly and certain weekly indexes appear in the DBS monthly publication *Prices and Price Indexes* (Catalogue No. 62-002) and a weekly DBS report gives indexes on a weekly basis for all groups and sub-groups.

The investors index is comprised of three major groups, with relative importance indicated by percentage weights as follows: industrials, 67.5; utilities, 18.6; and finance, 13.9. Each major group is further divided into industry sub-groups corresponding to the standard industrial classification. The mining index is composed of two groups: base metals with a weight of 64.6 p.c. and golds with a weight of 35.4 p.c. The index of preferred stocks is not divided into component groups.

15.—Index Numbers of Common and Preferred Stocks, 1961-70

(1961=100)

Year and Month	Investors Index				Mining Index ¹	Preferred Stocks ¹

SECTION 4. TRADE BY COMMODITY.....	1092	Part IV.—Travel Between Canada and Other Countries.....	1119
SECTION 5. TRADE BY SECTION AND BY STAGE OF FABRICATION.....	1099		

The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.

The subject of foreign trade covers more than the treatment of exports and imports of commodities, important though this is. In its broader sense, foreign trade is made up of the total international interchange of goods, services, securities and other financial transactions, all of which are presented in their appropriate relationship in this Chapter and in Section 4 of Chapter XXIV. Part I contains specially prepared information on Canada's trade with the Pacific Rim Countries. Part II gives detailed statistics of total foreign trade. Part III outlines the various ways in which the Federal Government promotes and encourages trade relationships, and contains a brief review of the Canadian tariff structure. Part IV contains a review of the extent of travel between Canada and other countries in 1969, with estimates of the amount of money expended for that purpose.

PART I.—CANADA'S TRADE WITH THE PACIFIC RIM COUNTRIES*

The "New West", as Prime Minister Trudeau has called the Pacific Rim† area, has emerged as one of primary interest in Canada's trade. The Federal Government's recent white paper on foreign policy places as much emphasis on the Pacific as on Latin America.

Canada has been experiencing shifts in trading partners in recent decades, as a result of differing rates of economic growth, the alignment of countries into regional trading blocs and the evolution of transportation facilities such as air freighters, bulk carriers and containerization. The major shift has been toward expansion of Pacific trade. Even though this should greatly broaden Canada's trade in the 1970s and provide balance and outlets for

* Prepared by Dr. M. P. Mathew, External Trade Division, Dominion Bureau of Statistics.

† "Pacific Rim", as defined here, includes all the countries in East Asia, Southeast Asia and Oceania, but excludes the United States, the Soviet Union and Latin America which border on the Pacific Ocean.

more of its products, Pacific trade involves several important facets to be considered.* First, it involves products requiring specifications different from those Canada is accustomed to produce for the North American and European markets. Secondly, there are two kinds of customer countries—those which are industrializing rapidly and have consumers with rising incomes and new tastes to satisfy, and those which require food but have shrinking opportunities for trade owing to inadequate resources and products. Thirdly, there are customers like the People's Republic of China, the requirements of which fluctuate greatly because of such factors as internal crop conditions or trading and political considerations.

Half the world's population borders on the Pacific Ocean. The world's fastest growing country (Japan) and its most populous country (China) are members of the Pacific bloc. A growing and balanced trade means prosperity, independence, stability and improved quality of life in the whole region. Trade between Canada and the Pacific area has increased phenomenally during the past decade (Tables 1 and 2) and that area is now Canada's third largest market, after the United States and Western Europe, and its third largest supplier. Canada has also been an important net direct investor in the region, having invested some \$500,000,000 more there than Pacific investors have placed in Canada.†

In the period following the conclusion of World War II, Canada, particularly Western Canada, has benefited from growing merchandise trade with the Pacific area, especially with Japan. Of the 54 principal commodities of Canada selling in Japan in 1969, which accounted for some 93 p.c. of Canada's exports to that country, as many as 48 were primarily of western Canadian origin. A similar development has occurred in trade with certain other Pacific countries.

The value of exports to the Pacific countries in 1969, at \$1,100,000,000, was double that of 1962 and represented 7 p.c. of Canada's total exports; imports at \$857,000,000 were more than double the value in 1965. The favourable balance provided foreign exchange with which to offset Canada's payments deficits with the rest of the world, especially the United States. Canada is an important supplier of foodstuffs needed by countries with rapidly growing populations, and also in recent years of industrial materials and capital goods. Sales of wheat and wheat flour continue to dominate export figures, followed by such raw materials as copper, aluminum, wood pulp, newsprint and lumber. Japan took the major portion of these exports in 1969, followed by Australia, the People's Republic of China, New Zealand, the Philippines, Hong Kong, Malaysia, South Korea and Taiwan.

Canadian trade relations with several Pacific Rim countries—Japan, Hong Kong and South Korea—are governed by the General Agreement on Tariffs and Trade (GATT). In addition, Canada has bilateral agreements with Japan and South Korea providing for the exchange of most-favoured-nation (MFN) treatment, but the latter maintains control on many imports. In Japan, licences are required for most imports and quota restrictions are maintained on a substantial group of items. Canada grants MFN facilities to Hong Kong and receives preferential treatment on a small range of products, but imports into Hong Kong are admitted relatively freely. A *modus vivendi* signed in 1946 governs Canada's trade relations with the People's Republic of China. Canada's trade with Australia and New Zealand is governed by the Commonwealth preference system. Canada and the Philippines provide MFN treatment to each other without any contractual agreement. Although the Philippines import regulations are quite liberal, credit restrictions are extensive and provide an effective barrier to imports. From one Pacific country to another, the composition of Canadian exports and imports, the opportunities for their growth, and the problems of access tend to vary widely. Canada's trade relations and the exchange of important commodities with the individual countries of the region are discussed below. Canada's principal exports and imports to and from the region as a whole are given in Tables 3 and 4.

East Asia

Japan.—A notable development in the Canada-Pacific Rim trade has been the growth of the Japanese market. Immediately following World War II, Japan's trade was preponderantly with the United States. In the 1960s, however, that country turned more and more to Canada, becoming third in importance to Canadian exporters, after the United States and the United Kingdom. Even though Japan is Canada's largest market and supplier in the Pacific, Canadian sales to that country are limited to industrial raw materials and foodstuffs, while finished goods make up the bulk of Japanese sales to Canada. A large proportion of the shipments of unprocessed materials is derived from direct Japanese investment, particularly in Western Canada, where more than \$100,000,000 has been invested to ensure sources of supply for rapidly growing industry. Work is also being done in Alberta to foster economic co-operation in the development of coal, copper and other commodity resources. Although this investment is advantageous to the development of Canadian resources, it still involves the export of these materials in the crudest and least-profitable form.

Domestic exports to Japan rose 250 p.c. from \$179,000,000 in 1960 to \$626,000,000 in 1969, and imports rose 350 p.c. from \$110,000,000 to \$496,000,000. Canada's access to the Japanese market for manufactured goods, as well as opportunities for investment, is limited by a broad range of direct and indirect restrictions, notwithstanding a movement toward liberalization in stages. Further efforts are required to lower or remove the existing non-tariff barriers to Canadian manufactures and to open up fully opportunities for Canadian investment. In the meantime, Japan's demand for all types of goods, especially industrial raw materials, continues to grow. Shipments of many Canadian goods rose significantly in 1969, particularly of commodities such as flaxseed, copper, aluminum, iron ore, wood pulp and newsprint.

Japan must import much of the raw materials required by industry and prefers, like the United Kingdom at a similar stage of economic development, to import these in the crudest possible form. In consequence, basic foodstuffs (mostly grains) and unprocessed materials (ores, fuels and forest products) have accounted for something like 94 p.c. of Canada's exports to Japan in recent years. Minerals alone accounted for 42 p.c. of total commodity shipments in 1969 of \$626,000,000 to Japan, compared with 26 p.c. a decade ago. The rise in mineral exports to Japan contrasts with the diminished importance of Canadian grain shipments—13 p.c. in 1969 against over 40 p.c. ten years previously.

Canada's relative proximity to Japan and the construction of new port facilities are encouraging low-cost bulk commodity exports, and Canadian political and economic stability has encouraged Japanese customers to enter into long-term contracts for the development and supply of mineral resources.

At \$133,000,000, following a 21-p.c. rise over 1968, copper concentrates represented the largest single commodity in Canadian exports to Japan in 1969. It should be noted that while Canadian copper exports to the Japanese market showed a sixfold increase in value from \$20,000,000 in 1962, they rose by considerably less than three times in volume, indicating a more than doubling in the price of copper during the 1962-69 period.* The share of Canada's total copper production that is shipped to Japan almost doubled during the 1962-69 period from 10 p.c. to nearly 20 p.c. Despite the increase in projected copper exports to \$570,000,000 (350,000 tons) by 1973, it is expected that Canada will still rank second in importance to the Philippines. In addition to copper, Canada also supplies 40 p.c. of Japan's requirements of zinc concentrates as well as substantial quantities of molybdenum, uranium, iron ore, lead and aluminum.

Impressive improvements in the standard of living are changing Japan from traditional to contemporary consumption patterns. For example, the per capita rice consumption dropped from over 200 lb. in 1960 to 160 lb. in 1969, but that of fruits and vegetables and prepared foods increased considerably and bread has become an important consumption item. Thus, Japan has recently had a surplus of home-grown rice and has had to import 15 p.c. more food yearly. In addition, internal production of some agricultural commodities like rapeseed is being abandoned in favour of imports. During the past decade, Canada's three largest agricultural product markets—the United Kingdom, the United States and the European Economic Community—grew little, whereas exports to Japan doubled and those to other countries tripled.† Currently, annual exports of agricultural products to Japan are only slightly behind those to the United States and are well ahead of those to the EEC. Wheat and flour exports going to that country have amounted to almost \$100,000,000 yearly for several years and it has become Canada's leading market for rapeseed and flaxseed; 300,000 tons of rapeseed were shipped to Japan in 1969, a tenfold increase in the decade. Japan's per capita meat consumption, including poultry, while still less than 30 lb. a year, is rising rapidly so that, because of its limited supply of arable land, the importation of large quantities of feed grains will become necessary. Canada, already an important supplier of barley, has an opportunity to expand its exports of that grain in competition with other producers such as France. Prospects also exist for increased shipments of Canadian beef and pork.

Canada has become one of Japan's fastest growing overseas markets, increasing 38 p.c. in 1969 over 1968. As stated previously, almost all major Canadian exports to Japan to date have been primary commodities and imports have been mostly processed goods, including capital equipment for the power and oil industries, commodities for transportation requirements, and consumer goods. The wide variety of manufactured goods imported from Japan in 1969 included: communication and related equipment, \$74,600,000 (\$7,700,000 in 1960); motor vehicles and parts, \$71,400,000 (\$300,000); textile materials, \$51,900,000 (\$14,800,000); iron and steel products, \$45,200,000 (\$6,400,000); apparel and accessories, \$31,600,000 (\$20,300,000); non-farm machinery, \$19,900,000 (\$1,000,000); photographic goods, \$12,200,000 (\$3,400,000); plywood, \$9,100,000 (\$3,500,000); footwear, \$8,300,000 (\$5,700,000); games and toys, \$7,300,000 (\$4,000,000); and sporting and recreation goods, \$7,100,000 (\$1,300,000).

Although total imports into Canada from all countries increased 159 p.c. from 1960 to 1969, those from Japan rose 349 p.c. from \$110,400,000 to \$495,700,000; automotive

* The Canada-Japan Trade Council, *Canadian Minerals and the Japanese Market* (Ottawa: 1970), p. 3.

† *Canadian Agriculture in the Seventies*, Report of the Federal Task Force on Agriculture (Ottawa: Information Canada, 1969), p. 46.

products and equipment showed the most spectacular increase. Canada has had a substantial trade balance with Japan for many years, rising irregularly from \$69,000,000 in 1960 to \$130,000,000 in 1969.

The People's Republic of China.—Foreign trade, a monopoly of the State, is conducted through China's 13 State trading corporations. In recent years, China, with a population of 750,000,000, has been a major market for Canadian wheat under a long-term agreement which came into force in August 1966. In 1968, sales of \$158,000,000 represented 15 p.c. of Canada's total wheat exports, and in 1969 wheat accounted for over 98 p.c. of Canada's total exports to China. While the Canadian Wheat Board concluded a contract in late 1969 for the sale of 2,200,000 tons for delivery up to October 1970, valued at approximately \$135,000,000, the outlook for continued sales beyond 1970 is difficult to assess on account of dramatic advances in China's agricultural productivity. Other commodities exported to China in 1969 were scrap iron and steel, totalling \$2,000,000.

Canada's imports from the People's Republic of China amounted to only \$27,000,000 in 1969 and consisted of a wide range of products including: apparel and accessories, \$8,200,000 (\$200,000 in 1960); green peanuts, \$4,600,000 (\$300,000); house furnishings, \$3,300,000 (\$600,000); cotton fabrics, \$2,800,000 (\$45,000); and walnuts, \$2,500,000 (\$2,700,000). Thus, the favourable trade balance with the People's Republic rose from \$3,000,000 in 1960 to \$95,000,000 in 1969.

Korea.—The South Korean economic boom which continued in 1969 was reflected in greater demand for imports. Even though the internal economy has been under restraint for some time, the real growth rate in gross national product exceeded 15 p.c. Although the United States and Japan continue to be the main suppliers to South Korea, Canadian sales have risen considerably in the past few years from \$7,800,000 in 1967 to \$13,200,000 in 1968 and \$15,700,000 in 1969. The major exports in 1969 were: sulphur, \$4,600,000; asbestos, \$3,000,000; potassium chloride, \$1,800,000; pulp and cattle, \$1,500,000 each; and newsprint \$450,000. Imports from South Korea also increased from \$4,600,000 in 1967 to \$12,200,000 in 1969. The latter included: apparel and footwear \$7,800,000; textile fabrics, \$1,500,000; plywood, \$600,000; tungsten, \$300,000; and transistor radios, \$200,000. Canada's trade balance with South Korea improved from \$2,000,000 in 1968 to \$3,500,000 in 1969. Trade with North Korea has been marginal; exports, mostly of pig iron, amounted to only \$253,000 in 1969.

Taiwan.—Bolstered by heavy foreign investment and energetic drive, the industrialization and real economic growth of Taiwan, with its highly concentrated population of 14,500,000, ranked among the highest in the world in the postwar period. As a consequence, its international trade expanded rapidly. At present, food processing, textiles and electronics are the key sectors of the economy. Canada's trade with Taiwan is buoyant in foodstuffs, raw materials, certain manufactures and capital equipment. Of the total exports to Taiwan of \$12,700,000 in 1969 (\$2,900,000 in 1960), sulphur accounted for \$3,900,000; wheat, \$2,000,000 (\$100,000 in 1960); rapeseed and wood pulp, \$1,500,000 each; and aluminum \$500,000. There were substantial exports of potash in 1967 and 1968.

Of the total imports from Taiwan of \$42,500,000 in 1969 (\$1,100,000 in 1960), veneer and plywood accounted for \$12,600,000 (\$300,000); apparel and accessories, \$12,000,000 (\$500,000); footwear, \$5,500,000; canned vegetables, \$2,500,000; and communications and related equipment, \$2,400,000.

Generally, throughout the 1960s, Canada has had an unfavourable trade balance with Taiwan, the mounting deficit reaching nearly \$30,000,000 in 1969.

Hong Kong.—Essentially a free port with no tariffs except on liquor, tobacco, petroleum products and motor vehicles, Hong Kong with its population of 4,000,000, has enjoyed rapid industrial expansion and a profitable tourist trade.

The pattern of Canada's trade with Hong Kong is somewhat similar to that with Taiwan, providing growing opportunities for Canadian exports as well as problems with respect to the importation of textiles, which continue to rank among the colony's most important manufactures. Canada had a trade surplus with Hong Kong in 1961 and 1962, but has since been running a deficit which amounted to \$54,000,000 in 1969. Canadian exports to Hong Kong ranged between \$17,000,000 and \$19,000,000 in the three years 1967-69, somewhat below the level of \$22,000,000 in 1960. The principal exports included wheat and flour, aluminum, newsprint, plastic materials, pharmaceutical products and medicinal plants.

Imports in 1969, valued at \$72,900,000 against \$15,500,000 in 1960, included: apparel and accessories, \$34,200,000 (\$7,600,000 in 1960); toys, games and dolls, \$7,000,000 (\$500,000); communication and related equipment, \$2,300,000 (\$100,000); cotton fabrics, \$2,100,000 (\$41,000); artificial and ornamental flowers, \$1,900,000 (\$33,000); footwear \$1,800,000 (\$900,000) and jewellery, \$1,600,000 (\$100,000).

Oceania

Australia.—Trade between Canada and Australia is based on the Canada-Australia Trade Agreement of 1960. There are no major barriers to trade, both countries admitting specified goods at preferential rates of tariff. In the past decade, the course of total trade has been characterized by growth—nearly doubling from \$135,000,000 in 1960 to \$265,000,000 in 1969.

Exports to Australia, Canada's second largest market in the Pacific area, grew by an average of 6½ p.c. a year over the decade. Domestic exports in 1969 amounted to \$168,600,000 and imports to some \$96,000,000, compared with \$99,800,000 and \$36,000,000, respectively, in 1960. Nearly 85 p.c. of the 1969 exports represented manufactured and semi-manufactured goods, the principal items being: motor vehicles and parts, \$30,700,000; newsprint, \$22,300,000; lumber, \$15,800,000; non-farm machinery, \$13,500,000; wood pulp, \$9,300,000; asbestos, \$7,800,000; sulphur, \$7,400,000; aircraft and parts, \$4,700,000; nickel and alloys, \$3,100,000; plastics, \$3,000,000; and steel, \$2,100,000. In all, Canada supplied some 4 p.c. of Australia's import requirements in 1969.

Canada, on the other hand, imports less than 1 p.c. of its requirements from Australia. The more important imports include primary products, mainly processed meats, canned and dried fruits, sugar, wine and wool, and products of agriculture and ranching.

Canada's substantial trade surplus with Australia rose moderately from \$64,000,000 in 1960 to \$72,000,000 in 1969. Canadian technology has been of considerable interest to Australians in their drive for industrialization in such fields as communications, nuclear power, nickel refining, natural gas pipelines, fisheries and forest fire fighting. Canadian companies engaged largely in mining and manufacturing have invested more than \$350,000,000 in Australia.

New Zealand.—The trade between Canada and New Zealand has been mutually advantageous to the two countries. Canadian exports in 1969 amounted to \$37,800,000 and imports to \$41,200,000. Except for a small trade deficit in 1969, Canada maintained a surplus with New Zealand during the 1960s ranging from \$14,000,000 to \$27,000,000. The main exports to New Zealand in 1969 were: aluminum, \$7,100,000; sulphur, \$5,300,000; non-farm machinery, \$4,500,000; plastics, \$2,500,000; aircraft and parts, \$2,000,000; potassium chloride, \$1,900,000; copper and alloys, \$1,800,000; and asbestos, \$1,100,000. The chief imports were: beef, \$29,700,000; sausages, \$3,300,000; wool and animal hair, \$3,000,000; and mutton and lamb, \$2,100,000.

Future exports to Australia and New Zealand could be affected not only by the industrialization policies of these countries but also by the possible entry of Britain into the European Economic Community. Such a development could bring about adjustments in the Commonwealth preference system, together with a change in the importance of their trade with countries such as Japan and the United States.

Other Oceania.—Canada's exports to British, French and U.S. Oceania, which in 1969 were valued at \$2,600,000, consisted mostly of wheat flour, barley, canned fish, lumber, newsprint and machinery; imports from these islands were valued at \$2,800,000. Total exports to and imports from Fiji were \$900,000 and \$5,700,000, respectively.

Southeast Asia

There is considerable diversity among the countries of Southeast Asia. On a per capita basis, the national product of Singapore is perhaps ten times that of Burma, whereas the GNP growth rate, calculated at constant prices, ranges from more than 8 p.c. in Singapore to 2 p.c. in Burma. Again, while manufactured goods account for half of Singapore's exports, primary products—including minerals—constitute the major portion of exports elsewhere. Improved strains of rice and wheat have produced remarkable results, creating new difficulties for Canada as an exporter of grains.

Canada's trade relations with several southeast Asian countries—Malaysia, Singapore, Burma, Cambodia and Indonesia—are governed by the General Agreement on Tariffs and Trade. In addition, Canada grants most-favoured-nation treatment to Laos and Viet-Nam, and exchanges MFN treatment with the Philippines. Preferential treatment is exchanged between Canada and both Singapore and Malaysia but the latter maintains licensing control on many imports. Imports are admitted relatively free into the Philippines, Singapore and Thailand. In Indonesia, Laos and Viet-Nam most goods require licences.

The ten independent countries in the southeast Asian region provided a \$70,000,000 market for Canada in 1969. Imports from the region consist mostly of a wide variety of tropical raw materials and consumer goods. Aid programs financed by the Canadian International Development Agency create many openings for exports, as well as private investment programs by Canadian mining interests in the Philippines and Indonesia.

The Philippines.—Canada's exports to the Philippines, with a total population of 37,000,000, rose from \$18,800,000 in 1966 to \$32,500,000 in 1969, making this country one of the Philippines' leading trading partners. Among the leading exports from Canada are: capital equipment, especially communications equipment; construction, mining and forestry machinery; motor vehicles and parts; raw and semi-processed industrial materials such as aluminum, zinc, copper, chemicals and synthetic rubber; insulated wire and cable; newsprint; wood pulp; and brewer's malt. The presence in the Philippines of subsidiaries of General Motors, Ford and International Harvester has led to a substantial growth in imports of knocked-down motor vehicles, chassis and parts; the value of automotive products imported from Canada rose from only \$23,000 in 1960 to \$9,100,000 in 1969, representing some 28 p.c. of all Canadian exports to the Philippines.

The Philippine national economy relies heavily on the exports of raw materials, including coconut products, sugar, lumber, natural fibres and minerals. Canadian imports from the Philippines in 1969 included: desiccated coconut, \$1,200,000; pineapple products, \$1,100,000; chrome ores and concentrates, \$600,000; and veneer and plywood, \$400,000. Canada's trade surplus with the Philippines nearly doubled during the 1960s to \$28,000,000 in 1969.

Indonesia.—Canada's trade with Indonesia, which has a population of 110,000,000, is still limited. Exports to that country rose from \$400,000 in 1966 to only \$3,100,000 in 1969, the main items being: wheat flour, \$1,200,000; newsprint, \$400,000; electric lighting and equipment, \$300,000; industrial machinery, \$300,000; and skim milk and milk powder, \$200,000. Current imports from Indonesia remained insignificant at only \$284,000 in 1969 compared with \$448,000 in 1968. The major items were: spices, \$118,000; tea, \$45,000; natural rubber, \$36,000; and sisal and agave fibres, \$28,000.

Malaysia.—Even though a wide range of commodities is subject to import duty and import licences are issued on a quota basis, the outlook in Malaysia is promising. Total Canadian exports to Malaysia rose from \$5,100,000 in 1960 to \$16,000,000 in 1969, when

they included aircraft, asbestos, newsprint, aluminum and wheat. Aircraft and parts, valued at \$7,800,000, were shipped in 1969 under a special assistance program. Canadian imports from Malaysia, valued at \$32,800,000 in 1969 (\$28,400,000 in 1960), included: tin, \$13,200,000; natural rubber, \$9,300,000; palm oil and coconut oil, \$2,300,000 each; lumber, \$1,400,000; and raw sugar, \$1,000,000. Canada's trade deficit with Malaysia, which was \$16,800,000 in 1969, ranged between \$8,000,000 and \$31,000,000 in the 1960s.

Singapore.—Although Singapore is a city state of 220 sq. miles and 2,000,000 people, Canada's exports to that country amounted to \$5,000,000 in 1969, mainly in the following categories: wheat, other foodstuffs, tobacco, asbestos, metals, potassium chloride, sulphur, newsprint, non-farm machinery, motor vehicles, and communication and related equipment. Imports from Singapore, valued at nearly \$22,000,000 in 1969, included: crude rubber, \$13,600,000; canned pineapple, \$3,100,000; and apparel and accessories, \$2,500,000. Canada's trade deficit with Singapore rose from \$8,300,000 in 1967 to \$17,000,000 in 1969.

Viet-Nam.—Because of the unsettled political situation in Viet-Nam, trade between Canada and that country is of minor importance. Exports to that country in 1969 were valued at \$2,100,000, comprising: newsprint, \$515,000; whisky, \$439,000; cod, \$299,000; asbestos, \$255,000; milk powder and skim milk, \$205,000; medicinal and pharmaceutical products, \$132,000; and sugar, \$117,000. Imports were negligible.

Cambodia and Laos.—Canada's trade with Cambodia and Laos has been insignificant. Exports to that area were valued at \$204,000 in 1969 compared with \$60,000 in 1967, and consisted mainly of: newsprint, \$162,000; asbestos, \$24,000; and building paper, \$10,000. Imports were again negligible.

Thailand.—Canada's export trade to Thailand increased from \$2,700,000 in 1960 to \$8,700,000 in 1969, the latter including foodstuffs, metals, asbestos, newsprint, machinery, motor vehicles, electrical equipment, hand tools, and aircraft. Imports changed little during the 1960s, being only a shade under \$1,000,000 in 1969, and including lumber, kapok, jute, and sago and cassava starch. Canada's favourable trade balance with Thailand accordingly rose from \$1,900,000 in 1960 to \$7,700,000 in 1969.

Burma.—Commercial links with Burma have been rather tenuous. Canada exported \$1,500,000 worth of goods to that country in 1969, consisting of: wheat flour, \$646,000; pens and mechanical pencils, \$383,000; asbestos, \$264,000; and hoisting machinery and parts, \$25,000. Imports in the same year amounted to only \$55,000, accounted for mainly by hardwood veneer. Canada's trade surplus with Burma was \$1,400,000 in 1969 against \$664,000 in 1968.

Conclusion

While trade development was oriented toward the Atlantic area during the immediate post-World-War-II period, there has been a recent shift in emphasis to the Pacific where, in the past ten years, exports increased by 190 p.c. compared with an increase in total exports of 175 p.c. An important element in this expansion has been trade with Japan. Raw materials—comprising coal, metallic concentrates, forestry products, and other bulk commodities—will probably remain most prominent among Canadian exports to Japan, but opportunities are appearing in relatively new fields, and increases may be expected in processed foods, breeding stock, consumer goods and a variety of manufactures.

Investment will become an increasingly important factor in the growth of Canada's trade with the Pacific Rim countries. Canadian business, including a number of Canada-based multi-national corporations, is evincing considerable interest in the opportunities for investment and the promotion of engineering services in the Pacific, especially in Australia and Southeast Asia. The Government of Canada has initiated a Foreign Investment Insurance Program for developing countries and is examining possibilities for the extension of these guarantee arrangements to Pacific countries.

PART II.—FOREIGN TRADE STATISTICS*

Section 1.—Explanatory Notes on Canadian Trade Statistics

Sources.—Canadian foreign trade statistics are compiled from information recorded on customs documents received by the Dominion Bureau of Statistics from the various customs ports in Canada, supplemented with energy data obtained through other channels. It should be noted that trade figures reflect the physical movements of goods across Canada's national and customs boundaries, but do not always represent the financial transactions for changes in ownership of these goods.

Coverage.—Total Canadian exports are the sum of domestic exports and re-exports. Domestic exports or exports of Canadian produce include shipments abroad of goods wholly produced in Canada together with exports of previously imported goods which have been changed in form by further processing in Canada. Re-exports or exports of foreign produce include only goods previously included in import statistics which are exported from Canada in the same form as when imported. Minor operations such as cleaning, sorting or re-packing are not considered as changing the condition of imported goods. Following the introduction in January 1964 of the "General Trade" system of compilation, re-exports have also included outward movements of goods previously imported but stored in customs warehouses.

Likewise, imports, as from January 1964, include all goods cleared by customs immediately on arrival in Canada together with goods that are entered into customs warehouses. For earlier years, imports under the "Special Trade" system of presentation included goods cleared immediately on arrival plus goods cleared for consumption out of customs warehouses. This meant that those goods, which crossed the national boundary into and out of customs warehouses without crossing the customs boundary, were excluded.

Certain commodities have, since January 1960, been excluded from both export and import trade statistics but have been published monthly under "Special Transactions—Non-trade". This category includes commodity movements which either have no international financial implications or are better considered as non-merchandise transactions in the statistics of Canada's balance of international payments. These are: unrefined gold, gold products where the gold content is 80 p.c. or more of the total value, and gold coin, except collections; settlers' effects; private donations and gifts; tourist purchases; goods shipped back and forth across the national boundary by the diplomatic and military personnel of Canada and of foreign countries posted abroad and in Canada, respectively; temporary movements for exhibition or competition, including films for processing; bunker supplies and stores sold to foreign vessels or aircraft in Canadian ports or purchased by Canadian carriers abroad; military grants to NATO member countries; ships of British construction and registry imported for use in Canada, and ships purchased for use as international carriers but not used to carry goods between points in Canada; and generally, all temporary exports and imports and goods merely moving in transit through Canadian territory.

The series "New Gold Production Available for Export", which has been published as a supplement to external trade statistics, is deleted. Being an item of non-merchandise transactions in the current account, it is described in Chap. XXIV, Sect. 4, on the Canadian balance of international payments.

Valuation.—The basic source documents require the reporting of exports at transaction values, f.o.b. place of lading (i.e., exclusive of inland freight, insurance, handling and other charges). Declarations denominated in foreign currency are converted to Canadian dollars for publication. The value of goods imported is usually that as determined for customs duty, and the Canadian Customs Act generally requires the valuation of goods f.o.b. point of shipment in the country of provenance. However, continuing effort is made

*Prepared in the External Trade Division, Dominion Bureau of Statistics.

to prevent the inadvertent filtering through during document processing of c.i.f. values, in particular for free goods or goods subject to specific rates of duty.

Classification.—Beginning with statistics for January 1961, a new export commodity classification was used, based on the Standard Commodity Classification developed by the DBS as a tool for integrating statistical series derived from different sources. Whereas the classification previously used classified commodities primarily according to the material of which they were chiefly composed, the new classification places commodities in sections mainly according to stage of processing and purpose, as follows: Live Animals; Food, Feed, Beverages and Tobacco; Crude Materials, Inedible; Fabricated Materials, Inedible; End Products, Inedible; and Special Transactions—Trade. For most of the commodities of major importance in Canadian exports, the classes of the new commodity classification are substantially identical with those of its predecessor.

As from January 1964, a new commodity classification was also introduced for import statistics, based on concepts similar to those embodied in the export commodity classification, so that there has been a closer correspondence between the two sets of statistics. The import commodity classification is more extensive than the export commodity classification and in its new form gives a comprehensive coverage of those commodities which constitute the bulk of Canada's import trade. The grouping system employed in the new classification also makes easier the identification of other commodities which may merit separate specification; continuing study is being made to keep the classification both meaningful and up to date in the dynamic environment in which commodities entering international trade are becoming more sophisticated and complex.

Trade is credited to countries on the basis of consignment. For exports from Canada, the country of consignment is that country to which goods are, at the time of export, intended to pass without interruption of transit except in the course of transfer from one means of conveyance to another. For imports into Canada, the country of consignment is the country from which the goods came without interruption of transit except in the course of transfer from one means of conveyance to another. This is not necessarily the country of actual origin, since goods produced in one country may be imported by a firm in another country and re-sold to Canada; in such cases the second country is the country of consignment to which the goods are credited. There is one exception to this rule; an attempt is made to classify by country of origin goods produced in South America, Central America, Bermuda and the Antilles and consigned to Canada from the United States. The effect of this procedure is to reduce slightly the imports credited to the United States and to increase those credited to South and Central American countries.

The country sub-totals include trade with Commonwealth and other countries (the Republic of Ireland and the Republic of South Africa) entitled to Preferential rates of duty. Trade with Alaska and Hawaii is included in the United States statistics in all the relevant tables of this Chapter, even though these two areas were separately classified prior to January 1959 and January 1960, respectively.

Discrepancies in Trade Statistics Between Canada and Other Countries.—Canada's statistics of exports are rarely in exact agreement with the import statistics of its customers and parallel differences occur with Canadian imports. Major factors contributing to these discrepancies include:—

- (1) Differences in the system of valuation used by Canada and those of other countries, with respect to the treatment of transportation charges, fair market and transaction values.
- (2) Differences in the statistical treatment of special categories of trade, such as military supplies, government-financed gifts of commodities, postal and express shipments, tourist purchases, bunkers and warehouse trade.
- (3) Differing definitions of territorial areas.
- (4) Differing systems of crediting trade by countries, notably the consignment system used by Canada and the actual origin or ultimate destination system in use in some other countries.
- (5) Differences in the time at which trade is recorded in the statistics of partner countries caused by the time required for goods to move from one country to another.

Section 2.—Total Foreign Trade

In considering the figures in Sections 2 to 5, it should be noted that exports and imports of gold are excluded from among other commodities in all tables. There are, in the main, three sets of tariff rates in operation in Canada: British Preferential, Most-Favoured-Nation and General Tariff as described at pp. 1109-1110. Generally, the Canadian tariff imposes duties on a greater proportion of manufactured goods than of raw or semi-processed products.

1.—Value of Total Foreign Trade of Canada, 1955-69

NOTE.—An adjustment has been made for "Special Transactions—Non-trade" to present figures on "general trade system" throughout.

1 Less than \$500.

Section 4.—Trade by Commodity

This Section provides detailed information on the composition of Canada's exports and imports for 1968 and 1969. Table 7 shows exports and re-exports to and imports from all countries, the United Kingdom and the United States, classified by commodity section; Table 8 gives detailed statistics of all commodities of any importance exported from Canada to all countries, to the United Kingdom and to the United States; and detailed statistics for imports into Canada by section and commodity appear in Table 9.

7.—Exports to and Imports from All Countries, the United Kingdom and the United States, by Section, 1968 and 1969

Section 5.—Trade by Section and by Stage of Fabrication

Tables 10 and 11 present historical series of Canada's external trade for the period 1950-69 by section and by stage of fabrication with a view to throwing light on the changes in the anatomy of Canada's international trade. The estimates for the years prior to 1958 are subject to some limitations because of the introduction of the revised commodity trade classifications in the early 1960s.

Methodology.—To allocate exports and imports into the statistical framework based on stage of fabrication, viz., crude materials, fabricated materials and end products, requires a secondary classification of the commodities in certain sections of the Standard Commodity Classification (SCC). Live Animals (Section I), being a natural product, are considered as crude materials. Section II (Food, Feed, Beverages and Tobacco) is distributed as follows: crude materials include natural products not processed beyond cleaning or preparation for shipment, such as fresh fruits and vegetables, raw sugar, etc.; fabricated materials include commercial feed stocks and commodities which are further processed rather than used for direct consumption; end products comprise prepared pet feeds and commodities which require no further processing but are used directly for consumption, such as cheese, canned foods, whisky, cigars and cigarettes. Sections III, IV and V are as they are defined in the SCC. Thus, Section V (Inedible End Products) consists of articles rather than materials, that is to say, finished commodities which have attained their final degree of processing together with specific parts and accessories of machinery which are classified with the machinery. Section VI (Special Trade Transactions), which contains comparatively few classes, has been distributed on the basis of special studies.

Exports.—Canada's exports followed a generally upward trend during the two decades from 1950, with a steady increase from 1954. The value of domestic exports advanced more than 4½ times up to the end of 1969 to \$14,442,000,000, with the major sections showing varying rates of change. This growth was reflected in all sections except Live Animals where exports in 1969 were only about two thirds of the value in 1950. Exports of Food, Feed, Beverages and Tobacco increased some 73 p.c. to \$1,410,000,000. Inedible Crude Materials were up roughly 7½ times to \$2,463,000,000 and Inedible Fabricated Materials more than tripled to \$5,163,000,000. Inedible End Products, where the growth rate was most pronounced, were 20 times higher at \$5,316,000,000. In 1969, domestic exports were 9 p.c. above those in 1968. Inedible Fabricated Materials rose 6 p.c. and Inedible End Products continued their uptrend by rising 24 p.c.; the remaining sections recorded year-over-year declines.

Analysis by stage of fabrication shows that 1969 exports of crude materials at \$3,330,000,000 were 3½ times those of 1950. Over the same period exports of fabricated materials tripled to \$5,345,000,000, and end products were up 13 times to \$5,766,000,000. Whereas exports of crude materials in 1969 were 6 p.c. below the peak level of \$3,540,000,000 in the previous year, those of fabricated materials and end products showed increases of 6 p.c. and 23 p.c., respectively.

10.—Domestic Exports by Section and Stage of Fabrication, 1950-69

Over the 1950-69 period, the importance of end products in Canada's exports gained relatively to crude and fabricated materials. The relative contribution of crude materials to domestic exports declined from 30 p.c. to 23 p.c., and that of fabricated materials from 56 p.c. to 37 p.c. On the other hand, the share of end products increased from 14 p.c. to 40 p.c. Newsprint maintained its predominant place among fabricated materials, while commodities ranging from motor vehicles and aircraft to wearing apparel contributed to the rising importance of end products.

The key importance of the United States among Canada's export destinations advanced from 65 p.c. of the annual total in 1950 to some 71 p.c. in 1969. The proportion of domestic exports of crude materials and fabricated materials going to that country declined from 53 p.c. and 77 p.c. to 48 p.c. and 68 p.c., respectively, whereas that of end products rose from approximately 42 p.c. to 86 p.c. The United Kingdom's share of Canadian domestic exports declined from 15 p.c. to less than 8 p.c. in the same comparison but the representation of end products in the exports was only fractionally lower in the later year.

Imports.—Imports also advanced more than $4\frac{1}{2}$ times in the 1950-69 period to reach \$14,202,000,000. Between 1960 and 1969, however, imports rose 159 p.c. against an increase of 175 p.c. in exports. Thus, while expanding imports reflected the increasing prosperity of Canadians during the 1960s, the rise in exports was more vigorous. During the whole period, imports of Food, Feed, Beverages and Tobacco nearly tripled to \$1,044,000,000, Inedible Crude Materials rose 42 p.c. to \$1,055,000,000, and Inedible Fabricated Materials increased $3\frac{1}{2}$ times to \$2,905,000,000. About an eightfold rise was recorded in imports of each of the following: Live Animals to \$19,000,000, Inedible End Products to \$8,987,000,000, and Special Trade Transactions to \$192,000,000 in 1969. The proportion of total imports represented by Inedible End Products rose from 37 p.c. to 63 p.c., the corresponding reduction being borne by other sections. Food, Feed, Beverages and Tobacco and Inedible Crude Materials, each of which accounted for about 7 p.c. of total imports in 1969, had represented 12 p.c. and 24 p.c., respectively, in 1950. Proportionally, Inedible Fabricated Materials narrowed from 26 p.c. to 20 p.c.

From the viewpoint of the stage of fabrication, imports of crude and fabricated materials accounted for a steadily decreasing proportion of total imports, dropping from 30 p.c. each in 1950 to 12 p.c. and 22 p.c., respectively, in 1969. On the other hand, imports of end products raised their relative importance from 39 p.c. to 66 p.c. Thus, two thirds of Canadian imports are currently end products, and prominent among these are heavy machinery, equipment and tools, required in the construction, development and operation of Canadian industries, together with automotive products.

From an already commanding position of 67 p.c. in 1950, the share of Canada's total imports from the United States rose to about 73 p.c. in 1969. The proportion of crude materials imported from that country declined from 57 p.c. to some 47 p.c., whereas its share of fabricated materials and end products rose slightly from 63 p.c. to 64 p.c. and from 77 p.c. to 80 p.c., respectively. The share of the United Kingdom in Canadian imports fell from 13 p.c. in 1950 to less than 6 p.c. in 1969, all stages of fabrication contributing to the decline. Canada has recently been importing rapidly rising quantities of fabricated materials and end products from the European Economic Community and some Pacific Rim countries, notably Japan.

Conclusion.—It is apparent that the Canadian economy has been in a rapid process of diversification and that primary products are becoming progressively less important in Canada's foreign trade. End products, in contrast, have expanded their proportion in both exports and imports, due in particular in recent years to the increased two-way flow of automotive products arising from the Canada-United States Automotive Agreement of 1965. Canada has obviously attained a high degree of sophistication in its industrial development and the home market, too, has grown sufficiently to support a fairly broad spectrum of industrial activity.

PART III.—THE GOVERNMENT AND FOREIGN TRADE

Section 1.—Federal Foreign Trade Services*

Canada's economy continues to be vitally dependent on external trade. Trade brings prosperity, and with it the key to developing and expanding social programs, upgrading educational, medical and cultural standards, and narrowing regional disparities. But export growth is not easy to achieve. Competition among industrial nations is intense and will become more so. Although there is no panacea for this problem, a successful export trade can be assured by combining good products, efficient production, and aggressive, intelligent marketing with government support.

Federal Government support is provided through the Department of Industry, Trade and Commerce and the Export Development Corporation. The Department assists Canadian industry throughout the complete cycle—from research and development through production to marketing of the finished product. The Export Development Corporation, a Crown agency which reports to Parliament through the Minister of Industry, Trade and Commerce, provides insurance, guarantees, loans and other financial facilities to help Canadian exporters.

Industry, Trade and Commerce Units Involved in Export.—These units are: the General Relations and Area Relations Offices, the Industry, Trade and Traffic Services, Fairs and Missions, International Defence Programs Branches, and the Trade Commissioner Service. The Publicity Branch and the Office of the Industrial Policy Adviser have both international and domestic responsibilities. The Department's nine line branches, divided into Commodity Sectors, are concerned with promoting growth and efficiency in Canadian manufacturing (see Chap. XVI, Sect. 4), in addition to being active in trade development.

The *Office of General Relations* includes a General Trade Policy, a Commodity Trade Policy and an International Financing Division. The Office is responsible for advance planning of Canada's external trade policies and general trade policy affecting both primary and secondary manufacturing. It is also responsible for the planning, negotiation and administration of intergovernmental commodity agreements requiring close contact with representatives of Canadian producers, importers and industry associations. The Office participates in the development of policies and procedures for external aid, export credits and other export financing arrangements. It keeps Canadian exporters informed about the range of financing facilities provided by the Canadian Government and those available through international organizations.

The *Office of Area Relations* protects and improves the access of Canadian goods to export markets. It participates in the development and conduct of Canada's external trade relations, and in the formulation of Canadian trade policy. It assures that Canada's trading relationships with individual foreign countries and trading blocs are taken into account when domestic economic programs are being worked out. It is concerned with tariffs and other government activities which affect international trade. As a service to Canadian exporters, it supplies details on rates of duty, import restrictions, documentation requirements, and other foreign government measures affecting Canadian exports. In addition, Canadian businessmen may obtain from this Office information on economic and trading conditions in all parts of the world as well as assistance in planning visits to such markets.

The *Industry, Trade and Traffic Services Branch* consists of four Divisions: Industrial Traffic Services, Export and Import Permits, Market Analysis (Import) and Industrial and Trade Inquiries. The Industrial Traffic Services Division conducts a continuing study of shipping problems which affect trade, unitized cargo concepts, air and ocean freight rates and services, and air cargo utilization by geographic areas. The main purpose of the studies is to find reliable transportation at competitive rates for external trade. Another

*Prepared in the Canadian Division of the Publicity Branch, Department of Industry, Trade and Commerce, Ottawa.

objective is to help exporters select the most advantageous routes for moving their goods. The Division participates in international forums dealing with the movement of goods by sea.

The Export and Import Permits Division administers trade controls under the authority of the federal Export and Import Permits Act. The intention of the Act is to ensure, by export control, an adequate supply and distribution in Canada of goods necessary for defence or other needs. The Act also prevents any commodity sale that might be detrimental to the security of Canada. Other functions of this Division are to advise exporters on interpretation and requirements of the Export Control List and Regulations, to study the economic implications of the Export and Import Permits Act and to review control lists and practices.

The Industrial and Trade Inquiries Division provides foreign-based Canadian officers and trade development officers in Canada with appropriate information about Canadian products and companies. It maintains a multi-purpose data bank of Canadian companies and their export products. The Division provides guidance in matters not related to a particular commodity, such as the licensing of manufactures abroad, and assists businessmen unfamiliar with the operations of government by directing them to the appropriate department or agency.

The *Fairs and Missions Branch* co-ordinates all departmental activities designed to promote the sale of Canadian products and services abroad. This is done through participation in international trade fairs and in-store promotions, arranging trade missions to and from Canada and organizing visits to this country by individual buyers. Canadian products are displayed in both the Eastern and Western Hemispheres, and at recent trade fairs they have ranged from electronics equipment to cattle, from mining equipment to processed foods and from hospital equipment to electrical supplies. The Department of Industry, Trade and Commerce provides promotional publicity and first-class exhibits. It pays shipping costs for display items from Ottawa to the site of the fair. Incoming and outgoing trade missions are designed to overcome such problems as distance, language and unfamiliar market practices. Although immediate sales are the goal of most missions, future sales and foreign sales outlets are also important objectives. Some missions are of a fact-finding nature, examining new techniques or new products that could be made in Canada.

The *International Defence Programs Branch* promotes defence export trade through marketing programs aimed at the sale of Canadian defence equipment to friendly countries and the establishment of arrangements with Canada's allies for co-operative defence industrial research, development and production. A major activity is the Canada-United States defence-development and production-sharing program, which entails the joint development and reciprocal procurement of defence items. To ensure maximum Canadian industrial participation in United States defence programs, the Branch has offices in major American cities. Through specialists at Canadian missions abroad—including missions in London, Paris, Bonn and Rome and the Canadian Delegation to NATO—the Branch obtains access for Canadian defence products and technology to foreign markets.

The *Trade Commissioner Service* has 76 trade offices in 55 countries.* It promotes Canada's export trade and protects commercial interests abroad; acts as an export market consultant; secures market and credit information; brings foreign buyers in contact with Canadian sellers; recommends suitable agents; and supplies up-to-date information on export opportunities, terms of payment, tariffs, and import and exchange controls. It also maintains direct contact with individual companies and processes inquiries from Canadian businessmen.

If a Canadian firm is considering a market abroad for the first time, the trade commissioner can supply information on: (a) whether a particular commodity, or one similar to it, is in use in the area; (b) who uses it and for what purpose; (c) whether the country's

* Listed at intervals in the official publications *Foreign Trade* and *Commerce extérieur* of the Department of Industry, Trade and Commerce.

requirements are met by local production, by imports or by both; and (d) the probable reason why a commodity is not in use, the possibilities of developing a market for it, and how this might be done.

The scheduled return of trade commissioners for official tours of Canada is an effective means of imparting information to Canadian firms interested in export trade. Trade associations are informed well in advance of these visits so that appointments can be arranged. During his tour, the trade commissioner can discuss export problems with firms interested in exporting to his territory. Businessmen wishing to interview any trade commissioner on tour may arrange to do so by communicating with the Trade Commissioner Service, the Canadian Manufacturers' Association, the local Chamber of Commerce or Board of Trade, or one of the Department's regional offices.

The *Publicity Branch* supports foreign trade promotion programs by creating foreign consumer acceptance of, and demand for, Canadian products. The program of the International Division is geared to attract buyers to Canadian exhibits at trade fairs. Trade publicity officers, each a trade promotion specialist responsible for publicizing a group of commodities, co-ordinate a sales-oriented promotion program on behalf of Canadian manufacturers. Their techniques include providing stories and pictures to foreign news media representatives, placing advertising in foreign publications and sending promotion material, such as booklets and brochures, to trade commissioners for distribution to businessmen in their territory. In addition, a public relations firm is employed in Paris.

Another service is *Canada Courier*, a tabloid-size periodical which features articles and pictures about Canadian goods and services. It is published in six languages, with a circulation of approximately 225,000, mailed to potential buyers throughout the world. Two other publications, *Foreign Trade* and *Commerce extérieur* feature articles about export opportunities, changing conditions in foreign markets and how to gain access to these markets. *Foreign Trade* is published every two weeks, in English, and has a circulation of about 5,000; an annual subscription costs \$5 in Canada and \$7 outside the country. *Commerce extérieur* is published monthly, in French; an annual subscription costs \$2 in Canada and \$5 abroad.

The *Office of the Industrial Policy Adviser* is involved with policies and programs that have a bearing on industrial development. These include the effective adjustment of Canadian industry to changing conditions abroad as well as at home. The Office develops and maintains an up-to-date reservoir of intelligence on industrial policies in Canada and abroad and participates in the work of interdepartmental and international committees dealing with industrial policy matters.

The *Operational Branches* within the Department are Aerospace, Marine and Rail; Agriculture, Fisheries and Food Products; Apparel and Textiles; Chemicals; Electrical and Electronics; Machinery; Materials; Mechanical Transport; and Wood Products. Each line branch employs a group of commodity specialists who are responsible for assisting Canadian manufacturers to improve the quality and quantity of their production, and for promoting the sale of these products in domestic and world markets.

Each of these industry sector branches has responsibilities in the areas of export trade promotion and domestic industrial development. They lend assistance to Canadian companies already engaged in export activities and at the same time encourage companies with export potential to enter the highly competitive arena of international trade. Their industrial development responsibilities include conducting relative efficiency studies to determine the competitive capacity of Canadian manufacturers, and assisting companies to participate in the Federal Government's various incentive programs aimed at expanding research development and innovation activities in Canadian industry.

Office of Tourism.—The Office of Tourism comprises the Canadian Government Travel Bureau and the Travel Industry Branch. The Bureau is charged with promoting

travel to Canada from other countries; the Branch is concerned with the study and analysis of the Canadian travel industry, including Federal Government activities in support of tourism.

Canadian Government Travel Bureau.—To accomplish its primary function of attracting visitors to Canada, the Bureau undertakes extensive tourist advertising and promotion campaigns abroad, provides tourist publicity material for foreign newspapers, magazines, radio and television and film outlets, and works closely with travel agents and tour operators on three continents. It also maintains an extensive travel counselling service, providing brochures and information to about 2,000,000 potential visitors annually. Offices are operated in New York, Chicago, San Francisco, Minneapolis, Los Angeles, Boston, Philadelphia, Cincinnati, Rochester, Indianapolis, Cleveland, Detroit, Washington, Pittsburgh and Seattle in the United States; the Bureau also has representation in London, Paris, Frankfurt, Amsterdam, Mexico City, Tokyo and Sydney.

Travel Industry Branch.—The Branch is concerned primarily with the domestic travel industry. Its duties entail close examination of the nature and extent of tourist facilities and services in Canada and appraisal of their adequacy to meet visitor expectations; the study of federal, provincial and private programs and policies related to the growth and development of the travel industry; assessment of industry strengths, weaknesses and problems; and the preparation of advice to the Minister on ways and means to aid the industry. Close liaison is maintained with federal and provincial departments and agencies having activities related to travel and tourism and with major elements of the private sector of the Canadian travel industry.

The Branch also keeps under review the tourism and travel policies and practices of other countries, studies trends and developments in international tourism, and concerns itself with the activities of international organizations and agencies that affect Canada's travel industry.

Export Development Corporation (EDC).—This Corporation, under authority of the Export Development Act (SC 1968-69, c. 39), succeeded the 25-year-old Export Credits Insurance Corporation on Oct. 1, 1969. Its purpose is to facilitate the development of Canada's export trade by providing insurance, guarantee, loan and other financial facilities that enable Canadian firms to meet international credit competition. It reports to Parliament through the Minister of Industry, Trade and Commerce. Its affairs are administered by a 12-man board of directors. The chairman and seven of the directors are appointed from among persons employed in the Public Service of Canada and the remaining four from private business.

EDC functions are: to insure Canadian exporters against non-payment by foreign buyers due to credit or political risks over which neither buyer nor seller has any control; to issue guarantees to persons in respect of the financing of exports; to make loans to foreign buyers or to issue guarantees in respect of the purchase of capital goods or major services from Canada involving extended credit terms; and to insure Canadian investments abroad against non-commercial risks such as war or revolution, expropriation or confiscation, or the inability to repatriate capital or earnings.

Export credit insurance is available to all persons or corporations carrying on business in Canada to cover export sales made on customary credit terms. It provides protection against risks involved in the export, manufacture, treatment or distribution of goods, or the rendering of engineering, construction, technical, or similar services. Insurance is also available for a sale involving the manufacture, treatment or servicing of goods for, or the leasing of goods to, a foreign customer; the sale or licensing of any rights in a patent, trademark or copyright to a foreign customer; or the rendering to a foreign customer of any managerial, construction, technological, marketing or other such service.

The main risks insured include: insolvency or protracted default on the part of the buyer; exchange restrictions in the buyer's country preventing the transfer of funds to

Canada; cancellation of an import or an export licence or the imposition of restrictions on the import or export of goods not previously subject to restrictions; the occurrence of war between the buyer's country and Canada, or of war, revolution, etc., in the buyer's country. The insurance is available under the main classifications of general commodities and capital goods and services.

General commodities policies cover a policyholder's export sales to all countries for a period of one year, and are renewable. Two types are available: the contracts policy, which insures an exporter against loss from the time he books an order until payment is received; and the shipments policy, obtainable at lower rates of premium and covering the exporter from the time of shipment until payment is received.

Capital goods policies cover specific transactions involving such goods as plant equipment, heavy machinery, ships, aircraft, etc., where extended credit up to a maximum of five years may be necessary. Such transactions are one-time sales, and specific policies are tailored to each, but the general terms and conditions are the same as those applicable to policies for general commodities. Specific policies are also issued to cover engineering, construction, technical or similar service contracts entered into between Canadian firms and persons in foreign countries who have agreed to purchase such services. EDC may also extend unconditional guarantees to any person who agrees to provide non-recourse financing in respect of an insured export sale of capital equipment on medium-term credit.

EDC insures exporters on a co-insurance basis, the exporter retaining a small percentage of the risk involved. The same principle operates in the distribution of recoveries obtained after the payment of a claim. EDC is authorized to make loans to foreign buyers of capital equipment or services from Canada for which commercial financing is not available. In such transactions, the Canadian exporter applies for the loan on behalf of the buyer. The loan must normally be \$1,000,000 or more, and the credit terms required over five years. Guarantees may be given in respect of financing provided to a foreign importer of Canadian capital goods and services. EDC may also guarantee and, under certain circumstances, finance a portion of local costs involved in capital projects for which it has provided a loan or guarantee.

Foreign investment insurance may be provided with approval of the Governor in Council. Coverage is limited to investments in developing countries; it is restricted to a maximum of 15 years and to new investments only.

Section 2.—The Development of Tariffs

Limitations of space in the Year Book have made it necessary, in regard to tariffs, to adopt the policy of confining any detail regarding commodities and countries to tariff relationships in force at present and to summarize as much as possible historical data and details of preceding tariffs.

Subsection 1.—The Canadian Tariff Structure*

The Canadian Tariff consists, in the main, of three sets of tariff rates—British Preferential, Most-Favoured-Nation, and General.

British Preferential Tariff rates are, with some exceptions, the lowest rates. They are applied to imported commodities from British countries, with the exception of Hong Kong, when conveyed without trans-shipment from a port of any British country enjoying the benefits of the British Preferential Tariff into a port of Canada. Some Commonwealth countries have trade agreements with Canada that provide for rates of duty, on certain specified goods, lower than the British Preferential rates.

* Information relating to rates of duty, value for duty and anti-dumping duty is available from the Department of National Revenue, Customs and Excise, which administers the Customs Act, the Customs Tariff and the Anti-dumping Act.

Most-Favoured-Nation rates are usually higher than the British Preferential rates and lower than the General Tariff rates. They are applied to commodities imported from countries with which Canada has trade agreements. These rates would apply to British countries when they are lower than the British Preferential Tariff rates. The most important trade agreement concerning the effective rates applied to goods imported from countries entitled to Most-Favoured-Nation rates is the General Agreement on Tariffs and Trade (GATT).

General Tariff rates are applied to goods imported from the few countries with which Canada has not made trade agreements.

There are numerous goods which are duty free under the British Preferential Tariff, or under both the British Preferential and the Most-Favoured-Nation Tariffs, or under all Tariffs.

Valuation.—In general, the Customs Act provides that the value for duty of imported goods shall be the fair market value of like goods as established in the home market of the exporter at the time when and place from which the goods are shipped directly to Canada when sold “(a) to purchasers located at that place with whom the vendor deals at arm’s length and who are at the same or substantially the same trade level as the importer, and (b) in the same or substantially the same quantities for home consumption in the ordinary course of trade under competitive conditions”. In cases where like goods are not sold for home consumption but similar goods are sold, the value for duty shall be the cost of production of the goods imported plus an amount for gross profit equal in percentage to that earned on the sale of similar goods in the country of export. The value for duty ordinarily may not be less than the amount for which the goods were sold to the purchaser in Canada, exclusive of all charges thereon after their shipment from the country of export. Internal taxes in the country of export (when not incurred on exported goods), the cost of shipping goods to Canada and similar charges do not normally form part of the value for duty. There are, of course, further provisions for determining value for duty under the Act.

Anti-dumping Act.—Canada’s Anti-dumping Act (SC 1968-69, c. 10) provides, in brief, that where goods are dumped, i.e., the export price is less than the normal value, and such dumping has caused, is causing, or is likely to cause material injury to the production of like goods in Canada, or has materially retarded or is materially retarding the establishment of the production in Canada of like goods as determined by the Anti-dumping Tribunal, there shall be levied, collected and paid an anti-dumping duty. This anti-dumping duty is in an amount equal to the margin of dumping of the entered goods.

Drawback.—There are provisions in the Customs and Excise Tax Acts for the repayment of a portion of the duty, sales and/or excise taxes paid on imported goods used in the manufacture of products later exported. The purpose of these drawbacks (as these repayments are called) is to assist Canadian manufacturers to compete in foreign markets with foreign producers of similar goods. A second class of drawback, known as “home consumption” drawbacks, is provided for under the Customs Act and the Customs Tariff and applies to imported materials and/or parts used in the production of specified goods to be consumed in Canada.

The Tariff Board.—The organization and functions of the Tariff Board are described at pp. 150-151 of this volume.

Subsection 2.—Tariff and Trade Arrangements with Other Countries as at June 30, 1970

Canada’s tariff arrangements with other countries fall into three main categories: trade agreements with a number of Commonwealth countries; the General Agreement on Tariffs and Trade (GATT); and other agreements and arrangements.

The Commonwealth countries with which Canada has trade agreements providing for exchange of preferential rates are: Australia, the Bahamas, Barbados, Bermuda, Guyana,

British Honduras, Jamaica, the Leeward and the Windward Islands, Trinidad and Tobago, New Zealand, Britain and its dependent territories, and Malawi. Canada also exchanges preferences with Ceylon, Cyprus, Malaysia and Malta and accords preferences to India, Pakistan, Ghana, Nigeria, Kenya, Tanzania, Uganda, Zambia and Sierra Leone. Many of these countries are also members of the GATT. In addition, Canada has trade agreements with Ireland and South Africa under which preferences are exchanged.

Canada signed the Protocol of Provisional Application of the General Agreement on Tariffs and Trade on Oct. 30, 1947, and brought the General Agreement into force on Jan. 1, 1948. The Agreement provides for scheduled tariff concessions and the exchange of most-favoured-nation treatment among the contracting parties, and lays down rules and regulations to govern the conduct of international trade.

At the end of June 1970, there were 77 full members in the GATT. These countries and the effective dates of their accession are indicated in the following list. In addition, Tunisia was a provisional member. The GATT is applied on a *de facto* basis to a number of newly independent states—Algeria, Botswana, Democratic Republic of the Congo, Lesotho, Maldive Islands, Cambodia, Mauritius, Mali, Singapore and Zambia—pending decisions as to their future commercial policies.

Trade relations between Canada and a number of other countries are governed by trade agreements of various kinds, by exchange of most-favoured-nation treatment under Orders in Council, by continuation to newly independent states of the same treatment originally negotiated with the countries previously responsible for their commercial relations, and by even less formal arrangements.

Tariff and Trade Arrangements with Commonwealth Countries as at June 30, 1970

Country	Agreement	Tariff Treatment
AUSTRALIA.....	Trade Agreement signed Feb. 12, 1960; in force June 30, 1960. GATT effective Jan. 1, 1948.	Agreement includes schedules of tariff rates and margins and exchange of British preferential rates on items not scheduled. May be terminated on six months notice.
BARBADOS.....	Relations are based on Canada-West Indies Trade Agreement and protocol thereto (see Commonwealth Caribbean). GATT effective Nov. 30, 1966.	The parties exchange specified tariff preferences.
BOTSWANA.....	GATT: <i>de facto</i> application pending Botswana's decision on commercial policy.	Canada and Botswana exchange preferential tariff treatment.
BRITAIN.....	Trade Agreement signed Feb. 23, 1937; effective Sept. 1, 1937; modified by exchanges of letters Nov. 16, 1938 and Oct. 20, 1947. GATT effective Jan. 1, 1948.	Various concessions are granted by each country including exchange of preferential tariff rates. The Agreement (as modified) includes provisions relating to the Colonies, Dependencies and Trustships.
CEYLON.....	Relations continue to be governed by Trade Agreement of 1937 with Britain. GATT effective July 29, 1948.	Canada and Ceylon exchange preferential tariff treatment.
COMMONWEALTH CARIBBEAN (BAHAMAS, BERMUDA, BRITISH HONDURAS, THE LEEWARD ISLANDS, AND THE WINDWARD ISLANDS).	Canada-British West Indies Trade Agreement signed July 6, 1925, in force Apr. 30, 1927; Canadian notice of termination of Nov. 23, 1938, was replaced by notice of Dec. 27, 1939, which continued the Agreement. Protocol signed July 8, 1966 continues <i>ad interim</i> and amends Part I of the Canada-British West Indies Trade Agreement; terminates Part II of that Agreement and incorporates a number of additional provisions. Bermuda, British Honduras and the Leeward and the Windward Islands participate in GATT.	The parties exchange specified tariff preferences.

**Tariff and Trade Arrangements with Commonwealth Countries
as at June 30, 1970—continued**

Country	Agreement	Tariff Treatment
CYPRUS.....	GATT effective Aug. 16, 1960.	Canada and Cyprus exchange preferential tariff treatment.
GAMBIA.....	GATT effective Feb. 18, 1965.	Canada and Gambia exchange preferential tariff treatment.
GHANA.....	Relations continue to be governed by Trade Agreement of 1937 with Britain. GATT effective Oct. 18, 1957.	Canada accords British preferential treatment to Ghana (except on cocoa beans). Ghana extends most-favoured-nation treatment to Canada.
GUYANA.....	Relations are based on the Canada-West Indies Trade Agreement and protocol thereto (see Commonwealth Caribbean). GATT effective July 5, 1966.	The parties exchange specified tariff preferences.
INDIA.....	Since 1897 Canada has unilaterally accorded British preferential treatment without contractual obligation. GATT effective July 8, 1948.	Canada accords British preferential treatment to India. India extends most-favoured-nation treatment to Canada.
JAMAICA.....	Relations are based on Canada-West Indies Trade Agreement and protocol thereto (see Commonwealth Caribbean). GATT effective Aug. 6, 1962.	The parties exchange specified tariff preferences.
KENYA.....	GATT effective Dec. 12, 1963.	Canada accords British preferential tariff treatment to Kenya. Kenya extends most-favoured-nation treatment to Canada.
LESOTHO.....	GATT: <i>de facto</i> application pending Lesotho's decision on commercial policy.	Canada and Lesotho exchange preferential tariff treatment.
MALAWI.....	Malawi and Canada observe the terms of the 1958 Trade Agreement between Canada and the former Federation of Rhodesia and Nyasaland. GATT effective July 6, 1964.	Canada and Malawi exchange preferential tariff treatment.
MALAYSIA.....	Relations continue to be governed by Trade Agreement of 1937 with Britain. GATT effective Sept. 16, 1963.	Canada and Malaysia exchange preferential tariff treatment.
MALTA.....	Relations continue to be governed by Trade Agreement of 1937 with Britain. GATT effective Sept. 16, 1964.	Canada and Malta exchange British preferential treatment.
NEW ZEALAND.....	Trade Agreement signed Apr. 23, 1932; in force May 24, 1932, and subsequently amended. Latest amendments incorporated in a protocol signed May 13, 1970, but not yet in force at June 30, 1970. GATT effective July 26, 1948.	The parties exchange specific preferences on scheduled goods and reciprocally grant British preferential rates on items not scheduled. May be terminated on six months notice.
NIGERIA, FEDERATION OF.....	Relations continue to be governed by Trade Agreement of 1937 with Britain. GATT effective Oct. 1, 1960.	Canada accords British preferential treatment to Nigeria. Nigeria extends most-favoured-nation treatment to Canada.
PAKISTAN.....	Canada unilaterally accords British preferential treatment without contractual obligation. GATT effective July 30, 1948.	Canada accords British preferential treatment to Pakistan. Exchange of most-favoured-nation treatment.
RHODESIA.....	Canada does not recognize the present Government of Rhodesia.	Effective Nov. 11, 1965, Canada withdrew preferential treatment from Rhodesian goods, making them liable to the general tariff rate.

**Tariff and Trade Arrangements with Commonwealth Countries
as at June 30, 1970—concluded**

Country	Agreement	Tariff Treatment
RHODESIA—concluded.....		Effective Dec. 31, 1965, Rhodesia withdrew preferential treatment from Canadian goods and required that they pay the most-favoured-nation rate.
SIERRA LEONE.....	Relations continue to be governed by Trade Agreement of 1937 with Britain. GATT effective Apr. 27, 1961.	Exchange of most-favoured-nation treatment. Canada accords British preferential treatment to Sierra Leone. Sierra Leone extends most-favoured-nation treatment to Canada.
SINGAPORE.....	Relations continue to be governed by Trade Agreement of 1937 with Britain. GATT: <i>de facto</i> application pending Singapore's decision on commercial policy.	Canada and Singapore exchange preferential treatment.
TRINIDAD AND TOBAGO.....	Relations are based on Canada-West Indies Trade Agreement and protocol thereto (see Commonwealth Caribbean). GATT effective Aug. 31, 1962.	The parties exchange specified tariff preferences.
UGANDA.....	GATT effective Oct. 9, 1962.	Canada accords British preferential tariff treatment to Uganda. Uganda extends most-favoured-nation tariff treatment to Canada.
UNITED REPUBLIC OF TANZANIA.	GATT effective for Tanganyika Dec. 9, 1961 and extended to Zanzibar upon formation of United Republic Apr. 23, 1964.	Canada accords British preferential tariff treatment to the United Republic of Tanzania. Tanzania extends most-favoured-nation tariff treatment to Canada.
ZAMBIA.....	GATT: <i>de facto</i> application pending Zambian decision on commercial policy.	Canada accords British preferential treatment to Zambia. Zambia extends most-favoured-nation tariff treatment to Canada.

**Tariff and Trade Arrangements with Non-Commonwealth Countries
as at June 30, 1970**

Country	Agreement	Tariff Treatment
ALGERIA.....	Franco-Canadian Trade Agreement of 1933 applied to Algeria. Algeria maintains a <i>de facto</i> application of the GATT.	Since the creation of Algeria as an independent state in 1962, Canada has continued to grant most-favoured-nation treatment.
ARGENTINA.....	Trade Agreement signed Oct. 2, 1941; provisionally in force Nov. 15, 1941. GATT effective Oct. 11, 1967.	Exchange of most-favoured-nation treatment.
AUSTRIA.....	GATT effective Oct. 19, 1951.	Exchange of most-favoured-nation treatment.
BELGIUM-LUXEMBOURG.....	Convention of Commerce with Belgium-Luxembourg Economic Union (including Belgian colonies) entered into effect Oct. 22, 1924. GATT effective Jan. 1, 1948.	Exchange of most-favoured-nation treatment. May be terminated on one years notice.
BENELUX (BELGIUM-NETHERLANDS-LUXEMBOURG CUSTOMS UNION).	(See Belgium-Luxembourg and Netherlands.)	
BOLIVIA.....	Order in Council of July 20, 1935, accepted Article 15 of U.K.-Bolivia Treaty of Commerce of Aug. 1, 1911.	Exchange of most-favoured-nation treatment. May be terminated on one years notice.

**Tariff and Trade Arrangements with Non-Commonwealth Countries
as at June 30, 1970—continued**

Country	Agreement	Tariff Treatment
BRAZIL.....	Trade Agreement signed Oct. 17, 1941; provisionally in force from date of signing and definitively on Apr. 16, 1943. GATT effective July 31, 1948.	Exchange of most-favoured-nation treatment.
BULGARIA.....	Trade Agreement signed Oct. 8, 1963 and renewed on Oct. 8, 1966.	Exchange of most-favoured-nation treatment.
BURMA.....	GATT effective July 29, 1948.	Exchange of most-favoured-nation treatment.
BURUNDI.....	GATT effective July 1, 1962.	Canada grants most-favoured-nation treatment.
CAMBODIA.....	Franco-Canadian Trade Agreement of 1933 applied to Cambodia. Although not a full member, Cambodia takes part in the work of GATT under a special arrangement.	Since the creation of Cambodia as an independent state in 1955, Canada has continued to grant most-favoured-nation treatment.
CAMEROON.....	Franco-Canadian Trade Agreement of 1933 applied to Cameroon. GATT effective Nov. 28, 1960.	Exchange of most-favoured-nation treatment.
CENTRAL AFRICAN REPUBLIC....	Franco-Canadian Trade Agreement of 1933 applied to Central African Republic. GATT effective Aug. 14, 1960.	Exchange of most-favoured-nation treatment.
CHAD.....	Franco-Canadian Trade Agreement of 1933 applied to Chad. GATT effective Aug. 11, 1960.	Exchange of most-favoured-nation treatment.
CHILE.....	Trade Agreement signed Sept. 10, 1941; provisionally in force Oct. 15, 1941, and definitively on Oct. 29, 1943. GATT effective Mar. 16, 1948.	Exchange of most-favoured-nation treatment.
CHINA.....	<i>Modus vivendi</i> signed Sept. 26, 1946.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
COLOMBIA.....	Treaty of Commerce with Britain of Feb. 16, 1866, applies to Canada. Modified by protocol of Aug. 20, 1912, and exchange of notes Dec. 30, 1938.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
CONGO (BRAZZAVILLE).....	Franco-Canadian Trade Agreement of 1933 applies to Congo (Brazzaville). GATT effective Aug. 15, 1960.	Exchange of most-favoured-nation treatment.
CONGO (LEOPOLDVILLE).....	Belgo-Canadian Convention of Commerce of 1924 applied to Congo (Kinshasa). Maintains a <i>de facto</i> application of the GATT.	Since the Congo's independence in 1960, Canada has continued to grant most-favoured-nation treatment.
COSTA RICA.....	<i>Modus vivendi</i> signed Nov. 18, 1950; brought into force Jan. 26, 1951.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
CUBA.....	GATT effective Jan. 1, 1948.	Exchange of most-favoured-nation treatment.
CZECHOSLOVAKIA.....	Convention of Commerce signed Mar. 15, 1928; in force Nov. 14, 1928. GATT effective May 21, 1948.	Exchange of most-favoured-nation treatment.
DAHOMEY.....	Franco-Canadian Trade Agreement of 1933 applied to Dahomey. GATT effective Aug. 1, 1960.	Exchange of most-favoured-nation treatment.

**Tariff and Trade Arrangements with Non-Commonwealth Countries
as at June 30, 1970—continued**

Country	Agreement	Tariff Treatment
DENMARK (INCLUDING GREENLAND).	Treaties of Peace and Commerce with Britain of Feb. 13, 1660 and July 11, 1670, apply to Canada. GATT effective May 28, 1950.	Exchange of most-favoured-nation treatment. Declaration of May 9, 1912 provides means of separate termination by Dominions on one years notice.
DOMINICAN REPUBLIC.....	Trade Agreement signed Mar. 8, 1940; in force Jan. 22, 1941. GATT effective May 19, 1950.	Exchange of most-favoured-nation treatment.
ECUADOR.....	<i>Modus vivendi</i> signed Nov. 10, 1950; in force Dec. 1, 1950.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
EGYPT.....	(See United Arab Republic.)	
EL SALVADOR.....	Exchange of notes of Nov. 2, 1937; in force Nov. 17, 1937.	Exchange of most-favoured-nation treatment. May be terminated on four months notice.
ETHIOPIA.....	Exchange of notes effective June 3, 1955.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
FINLAND.....	Exchange of notes of Nov. 13-17, 1948; effective Nov. 17, 1948. GATT effective May 25, 1950.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
FRANCE AND FRENCH OVERSEAS TERRITORIES.	Trade Agreement signed May 12, 1933; in force June 10, 1933. Exchange of notes of Sept. 29, 1934, and additional protocol of Feb. 26, 1935. GATT effective Jan. 1, 1948.	Exchange of most-favoured-nation treatment including scheduled concessions. May be terminated on three months notice.
GABON.....	Franco-Canadian Trade Agreement of 1933 applied to Gabon. GATT effective Aug. 17, 1960.	Exchange of most-favoured-nation treatment.
GERMANY, FEDERAL REPUBLIC OF.	GATT effective Oct. 1, 1951.	Exchange of most-favoured-nation treatment.
GREECE.....	<i>Modus vivendi</i> by exchange of notes of July 24-28, 1947. GATT effective Mar. 1, 1950.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
GREENLAND.....	(See Denmark.)	
GUATEMALA.....	Trade Agreement signed Sept. 28, 1937; in force Jan. 14, 1939.	Exchange of most-favoured-nation treatment. May be terminated on six months notice.
GUINEA.....	Franco-Canadian Trade Agreement of 1933 applied to Guinea.	Since the creation of Guinea as an independent state in 1958, Canada has continued to grant most-favoured-nation treatment.
HAITI.....	Trade Agreement signed Apr. 23, 1937; in force Jan. 10, 1939. GATT effective Jan. 1, 1950.	Exchange of most-favoured-nation treatment.
HONDURAS.....	Exchange of notes signed July 11, 1956, effective July 18, 1956. Ratified in Honduras Sept. 5, 1956.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
HUNGARY.....	Trade Agreement signed June 11, 1964 for three-year period. Renewed Aug. 9, 1968 for a further three years from date of renewal.	Exchange of most-favoured-nation treatment and undertaking by Hungary to purchase Canadian goods to a value of \$15,000,000 during the three-year validity of new Agreement.
ICELAND.....	Although there is no contractual obligation, Canada and Iceland adhere to the terms of a treaty originally concluded between Denmark and Britain on Feb. 13, 1660. GATT effective Apr. 21, 1968.	Exchange of most-favoured-nation treatment.

**Tariff and Trade Arrangements with Non-Commonwealth Countries
as at June 30, 1970—continued**

Country	Agreement	Tariff Treatment
INDONESIA.....	GATT effective Mar. 1, 1948.	Exchange of most-favoured-nation treatment.
IRAN.....	Special arrangement by Order in Council effective Feb. 1, 1951. Iran accorded most-favoured-nation treatment from Sept. 5, 1956.	Canada grants most-favoured-nation tariff rates as long as Iran accords reciprocal treatment.
IRAQ.....	Special arrangement by Order in Council effective Sept. 15, 1951.	Exchange of most-favoured-nation tariff treatment.
IRELAND.....	Trade Agreement signed Aug. 20, 1932; in force Jan. 2, 1933. Modified by exchange of letters on Dec. 21, 1967. GATT effective Dec. 22, 1967.	Canada grants British preferential tariff in return for some bindings of tariff rates, for preferential rates where such exist and for most-favoured-nation rates on non-preferential items. May be terminated on six months notice.
ISRAEL.....	GATT effective July 5, 1962.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
ITALY.....	<i>Modus vivendi</i> by exchange of notes of Apr. 23-28, 1948; effective Apr. 28, 1948. GATT effective Jan. 1, 1950.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
IVORY COAST.....	Franco-Canadian Trade Agreement of 1933 applied to the Ivory Coast. GATT effective Aug. 7, 1960.	Exchange of most-favoured-nation treatment.
JAPAN.....	Agreement on Commerce signed Mar. 31, 1954; effective June 7, 1954. GATT effective Sept. 10, 1955.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
KOREA, REPUBLIC OF.....	Trade Agreement signed Dec. 20, 1966. GATT effective Apr. 14, 1967.	Exchange of most-favoured-nation treatment.
KUWAIT.....	GATT effective June 18, 1961.	Since independence of Kuwait in June 1961, Canada has continued to accord most-favoured-nation treatment.
LAOS.....	Franco-Canadian Trade Agreement of 1933 applied to Laos.	Since the creation of Laos as an independent state in 1955, Canada has continued to grant most-favoured-nation treatment.
LEBANON.....	Special arrangement by Order in Council of Nov. 19, 1946.	Canada grants most-favoured-nation tariff rates as long as Lebanon accords reciprocal treatment.
LIBERIA.....	Special arrangement by Order in Council effective Mar. 1, 1955.	Canada grants most-favoured-nation treatment.
LIECHTENSTEIN.....	(See Switzerland.)	
LUXEMBOURG.....	(See Belgium-Luxembourg.)	
MALAGASY REPUBLIC.....	Franco-Canadian Trade Agreement of 1933 applied to Malagasy Republic. GATT effective June 25, 1960.	Exchange of most-favoured-nation treatment.
MALI, FEDERATION OF.....	Franco-Canadian Trade Agreement of 1933 applied to Mali. Mali maintains a <i>de facto</i> application of the GATT.	Since the creation of Mali as an independent state in 1960, Canada has continued to grant most-favoured-nation treatment.
MAURITANIA.....	Franco-Canadian Trade Agreement of 1933 applied to Mauritania. GATT effective Nov. 28, 1960.	Exchange of most-favoured-nation treatment.
MEXICO.....	Trade Agreement signed Feb. 8, 1946; in force provisionally same date. Ratifications exchanged on May 6, 1947; definitively in force 30 days from that date.	Exchange of most-favoured-nation treatment. May be terminated on six months notice.

Tariff and Trade Arrangements with Non-Commonwealth Countries
as at June 30, 1970—continued

Country	Agreement	Tariff Treatment
MOROCCO.....	Various agreements relating to former French, Spanish and International Zones of Morocco.	Since the creation of Morocco as an independent state in 1956, Canada has continued to grant most-favoured-nation treatment.
NETHERLANDS.....	Convention of Commerce of July 11, 1924. Suspended during war; reinstated by exchange of notes Feb. 1 and 5, 1946. Includes Netherlands Antilles and Surinam. GATT effective Jan. 1, 1948.	Exchange of most-favoured-nation treatment. May be terminated on one years notice.
NICARAGUA.....	Trade Agreement signed Dec. 19, 1946; in force provisionally same date. GATT effective May 28, 1950.	Exchange of most-favoured-nation treatment.
NIGER.....	Franco-Canadian Trade Agreement of 1933 applied to Niger. GATT effective Aug. 3, 1960.	Exchange of most-favoured-nation treatment.
NORWAY.....	Convention of Commerce and Navigation with U.K. of Mar. 18, 1826, applied to Canada. GATT effective July 10, 1948.	Exchange of most-favoured-nation treatment. Convention of May 16, 1913 provides means for separate termination by Dominions on one years notice.
PANAMA.....	Order in Council of July 20, 1935 accepted Article 12 of U.K.-Panama Treaty of Commerce of Sept. 25, 1928. Treaty terminated in 1942.	While contractual obligation has expired, Canada and Panama continue to exchange most-favoured-nation treatment.
PARAGUAY.....	Exchange of notes of May 21, 1940; in force June 21, 1940.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
PERU.....	GATT effective Oct. 8, 1951.	Exchange of most-favoured-nation treatment.
PHILIPPINES.....	No agreement.	Canada and Philippines continue to exchange most-favoured-nation treatment (excluding preferences accorded by the Philippines to the United States) without contractual obligation.
POLAND.....	Convention of Commerce signed July 3, 1935, in force Aug. 15, 1936. GATT effective Oct. 18, 1967.	Exchange of most-favoured-nation treatment.
PORTUGAL, PORTUGUESE ADJACENT ISLANDS AND PORTUGUESE OVERSEAS PROVINCES.	Trade Agreement signed May 28, 1954 provisionally in effect July 1, 1954, definitively in force on ratification Apr. 29, 1955. GATT effective May 6, 1962.	Exchange of most-favoured-nation treatment. Remains in effect for two years from ratification and thereafter unless terminated on three months notice.
ROMANIA.....	Trade Agreement signed Mar. 22, 1968, for three-year period.	Exchange of most-favoured-nation treatment and Romanian undertaking to purchase Canadian goods to value of \$9,000,000 during three-year validity of Trade Agreement.
RWANDA.....	GATT effective Jan. 1, 1966.	Canada grants most-favoured-nation treatment.
SENEGAL.....	Franco-Canadian Trade Agreement of 1933 applied to Senegal. GATT effective June 20, 1960.	Exchange of most-favoured-nation treatment.
SOUTH AFRICA.....	Trade Agreement signed Aug. 20, 1932; in force Oct. 13, 1932. Exchange of notes Aug. 2-31, 1935; effective retroactively from July 1, 1935. GATT effective June 14, 1948.	Exchange of British preferential rates on scheduled items. May be terminated on six months notice. Exchange of most-favoured-nation treatment. May be terminated on six months notice.

SPAIN AND SPANISH POSSESSIONS.	Since Aug. 1, 1928, Canada has adhered to U.K.-Spain Treaty of Commerce of Oct. 31, 1922. Trade Agreement signed May 26, 1954, provisionally in effect July 1, 1954, definitively in force on ratification June 30, 1955. GATT effective Aug. 29, 1963.	Exchange of most-favoured-nation treatment. May be terminated on three months notice. Supplements and amends U.K.-Spain Treaty of Commerce. Remains in effect for three years from ratification, and thereafter unless terminated on three months notice.
SWEDEN.....	U.K.-Sweden Convention of Commerce and Navigation of Mar. 18, 1826 applies to Canada. GATT effective May 1, 1950.	Exchange of most-favoured-nation treatment. Declaration of Nov. 27, 1911 provides means for separate termination by the Dominions on one years notice.
SWITZERLAND.....	U.K.-Switzerland Treaty of Friendship, Commerce and Reciprocal Establishment of Sept. 6, 1855 applies to Canada. By exchange of notes Liechtenstein included under terms of this Agreement, effective July 14, 1947. GATT effective Aug. 1, 1966.	Exchange of most-favoured-nation treatment. Convention of Mar. 30, 1914 provides means for separate termination by the Dominions on one years notice.
SYRIAN ARAB REPUBLIC.....	Special Arrangement by Order in Council of Nov. 19, 1946.	Canada grants most-favoured-nation tariff rates as long as Syria accords reciprocal treatment.
THAILAND.....	<i>Modus vivendi</i> signed and brought into effect on Apr. 22, 1969.	Exchange of most-favoured-nation treatment.
Togo.....	Franco-Canadian Trade Agreement of 1933 applied to Togo. GATT effective Apr. 27, 1960.	Since the creation of Togo as an independent state in 1960, Canada has continued to grant most-favoured-nation treatment.
TUNISIA.....	Franco-Canadian Trade Agreement of 1933 applied to Tunisia. Tunisia has acceded to GATT provisionally.	Since the creation of Tunisia as an independent state in 1956, Canada has continued to grant most-favoured-nation treatment.
TURKEY.....	Exchange of notes signed Mar. 1, 1948; in effect Mar. 15, 1948. GATT effective Oct. 17, 1951.	Exchange of most-favoured-nation treatment. May be terminated on three months notice.
UNION OF SOVIET SOCIALIST REPUBLICS.	Trade Agreement signed Feb. 29, 1956, renewed for another three years Apr. 18, 1960 and again for the same period on Sept. 16, 1963 and again for the same period on June 20, 1966, and again on Mar. 1, 1969 (the extension in each case effective on the April 18 previous).	Exchange of most-favoured-nation treatment.
UNITED ARAB REPUBLIC (EGYPT).	Exchange of notes Nov. 26 and Dec. 3, 1952; in force Dec. 3, 1952. GATT effective May 10, 1970.	Exchange of most-favoured-nation treatment. May be terminated on six months notice.
UNITED STATES.....	Trade Agreement signed Nov. 17, 1938; suspended as long as both countries continue to be contracting parties to GATT. GATT effective Jan. 1, 1948.	Most-favoured-nation treatment exchanged.
UPPER VOLTA.....	Franco-Canadian Trade Agreement of 1933 applies to Upper Volta. GATT effective Aug. 5, 1960.	Exchange of most-favoured-nation treatment.
URUGUAY.....	Trade Agreement signed Aug. 12, 1936; in force May 15, 1940. Additional protocol signed Oct. 19, 1953. GATT effective Dec. 16, 1953.	Most-favoured-nation treatment.
VENEZUELA.....	<i>Modus vivendi</i> signed and brought into force Oct. 11, 1950.	Exchange of most-favoured-nation treatment. Made for one year subject to annual renewal.

**Tariff and Trade Arrangements with Non-Commonwealth Countries
as at June 30, 1970—concluded**

Country	Agreement	Tariff Treatment
VIET-NAM.....	Franco-Canadian Trade Agreement of 1933 applied to Viet-Nam.	Since the creation of Viet-Nam as an independent state in 1955, Canada has continued to accord most-favoured-nation rates.
YUGOSLAVIA.....	Trade Agreements Act of June 11, 1928, accepted Article 30 of U.K.-Serb-Croat-Slovene Treaty of Commerce and Navigation of May 12, 1927; in force Aug. 9, 1928. GATT effective Aug. 25, 1966.	Exchange of most-favoured-nation treatment.

PART IV.—TRAVEL BETWEEN CANADA AND OTHER COUNTRIES*

International travel between Canada and other countries in 1969 involved a total of 72,500,000 border crossings and an estimated \$2,400,000,000 in travel expenditures. Visitors from other countries to Canada numbered 36,200,000, of whom 35,800,000 were non-immigrants entering from the United States and 463,000 were visitors from overseas countries. In the same year, Canadians visiting other countries numbered 36,300,000, of whom 35,400,000 were residents who returned from the United States and 900,000 who returned from overseas. A high proportion of persons travelling between Canada and the United States entered and returned on the same day.

Expenditures of Canadians travelling abroad were estimated at \$1,300,000,000, of which amount \$892,600,000 was spent in the United States and \$399,100,000 was spent in overseas countries. Visitors to Canada from all countries spent an estimated \$1,100,000,000, of which \$961,300,000 was received from United States visitors and \$112,600,000 from overseas visitors. Thus, the excess of Canadian expenditures over receipts resulted in a deficit of \$218,000,000, as compared with a deficit of \$188,000,000 in 1968. The 1969 deficit was made up of a \$68,800,000 surplus account with the United States and a \$286,000,000 deficit with overseas countries. The larger deficit in 1969 over 1968 may be attributed in part to increased travel by Canadian residents to overseas countries but, more important, to the smaller surplus earned on the United States account, as Canadian spending outstripped the increase in United States spending in Canada. Heavier Canadian expenditures abroad were affected by the increase in charter flights and special excursions abroad which enabled students, young people and lower-income groups to travel more than in the past. It is also likely that the price inflation experienced in the major tourist centres of the world, which varied in intensity from country to country, added to the expenditures on foreign travel.

Travel Between Canada and the United States.—During 1969, some 35,765,600 United States residents spent an estimated \$961,300,000 in Canada; included in this number were 23,453,300 persons entering and leaving on the same day (excursionists and commuters) who spent \$121,100,000. The latter short-term traffic formed about 66 p.c. of the total entries but contributed only about 13 p.c. of the total expenditures. Travellers remaining one or more nights, who may be referred to as tourists, numbered 12,312,300 and spent an estimated \$840,200,000—34 p.c. of the volume but 87 p.c. of the expenditures.

In 1969, 12,200,000 non-resident automobiles entered Canada from the United States carrying some 31,000,000 persons, an increase of 2.1 p.c. in the number of persons compared with 1968. Of the total, 10,200,000 stayed one or more nights in Canada and during their visits spent \$561,500,000, almost 60 p.c. of the total receipts from the United States. The

* Prepared by the Travel Statistics Section, Economic Accounts Branch, Dominion Bureau of Statistics.

number of persons travelling by aircraft and bus increased but rail and boat traffic decreased (Table 2). Persons entering by air spent an estimated \$161,700,000; by bus \$80,100,000; by rail \$29,700,000; and by boat \$12,500,000.

Travel payments to the United States (excluding Hawaii) by Canadian visitors to that country amounted to \$851,600,000 in 1969. Canadian residents made 35,441,700 visits to the United States, 4.4 p.c. more than in 1968. Those entering and leaving on the same day increased by 2.5 p.c. but their spending was estimated to have increased 10.4 p.c. Travelers remaining for one or more nights in the United States numbered 9,300,000, an increase of 10 p.c., whereas their spending amounted to \$795,000,000, an increase of 26 p.c. over 1968.

Response to a voluntary questionnaire used to secure information on travel habits of Canadians travelling in the United States in 1969 (excluding motorists leaving and returning on the same day and "other travellers") indicated that 36.9 p.c. of those replying were residents of Ontario and their expenditures made up 44.9 p.c. of the total payments to that country. Quebec accounted for 35.3 p.c. of the travellers and 28.2 p.c. of their expenditures. Some 58.7 p.c. stated holiday or recreation as their main reason for visiting the United States, 25.5 p.c. visited friends or relatives and 8.7 p.c. went for business reasons. Quebec reported the highest percentage of holiday trips (65.8), the Atlantic Provinces reported the highest proportion of visits to friends or relatives (35.3), and Alberta the highest proportion of business trips (13.6).

Travel Between Canada and Overseas Countries.—Overseas visitors to Canada entering both directly and by way of the United States numbered 463,200 during 1969, and estimated receipts from these visitors amounted to approximately \$113,000,000, including transportation fares paid to Canadian carriers. The expenditures of these visitors while in Canada was estimated at \$80,000,000, an increase of 44 p.c. over the preceding year; the number of visits increased 28 p.c. However, the base figures are rather small compared with the United States travel figures and the percentage increases must be viewed with this in mind. Although the number and expenditures of overseas visitors to Canada in 1969 showed relatively large gains over the preceding year, they both represented declines from the record number of visitors and expenditures that marked Centennial year. The number of overseas visitors to Canada was almost 22 p.c. below the record 590,300 visitors in 1967 and expenditures were \$34,000,000 or 30 p.c. below the \$114,000,000 spent in 1967; both figures exclude transportation fares paid to Canadian carriers.

In 1969, 199,300 overseas visitors entered Canada direct and via the United States through the principal ports in Ontario, an increase of 50,200 over the figure for the previous year. Principal Quebec ports reported that 169,600 overseas visitors entered in 1969, an increase of 31,000 over 1968. The largest absolute gains were recorded at Toronto, Montreal and Vancouver airports, which had increases of 40,100, 24,900 and 9,900, respectively, over 1968. The area of residence reported by almost one third of the overseas visitors was the United Kingdom and residents of the countries comprising the OECD in Europe accounted for another 35 p.c.; of the latter, France and Germany accounted for 42 p.c. The main province of destination for overseas visitors was Ontario which attracted 41.8 p.c., followed by Quebec with 28.8 p.c., British Columbia 13.1 p.c., the Prairie Provinces 6.2 p.c. and the Atlantic Provinces 2.5 p.c. The remaining 7.6 p.c. were classified as "touring".

The average length of stay of overseas visitors during 1969 was estimated at 19 nights compared with 20 nights in 1968 and 16 nights in 1967. Visitors from the Netherlands stayed longer than those from other countries, averaging 28 nights in 1969 and 29 in 1968. Visitors from the United Kingdom stayed an average of 23 nights in 1969 and 24 in 1968; those from Germany stayed an average of 22 nights in 1969 and those from France 15 nights.

Canadians returning from visits to overseas countries in 1969 numbered 851,700, and their estimated net expenditure amounted to \$399,000,000, including payments to overseas carriers for transportation. A classification by area shows that \$145,000,000 was spent in the United Kingdom, \$153,000,000 in other OECD countries in Europe, \$52,000,000 in other Commonwealth countries, and \$49,000,000 elsewhere. Gross expenditures by Cana-

Malak

dians travelling overseas in 1969, including fares paid to domestic carriers, amounted to \$580,000,000. The average outlay per person was \$680, compared with \$697 in 1968.

The response to questionnaires distributed to Canadians returning from overseas in 1969 indicated that 54.0 p.c. resided in Ontario and 18.3 p.c. in Quebec. About 57 p.c. of the travel overseas was for recreation or holiday, 32 p.c. for visiting friends or relatives and 10 p.c. for business. The average length of stay was estimated at 26 nights. A total of 731,700 Canadians returned direct from overseas countries and 120,000 re-entered Canada by way of the United States.

*The interpretation of the symbols used in the tables throughout the Year Book
will be found on p. vii of this volume.*

Consolidated statistics of revenue and expenditure for all governments in Canada—federal, provincial and municipal—are presented in Section 1 of this Chapter and Section 2 covers the incidence of taxation at the three levels. More detailed information for each level of government is given in Sections 3, 5 and 6. Section 4 gives information on joint federal-provincial programs and on the extent of federal financial participation in such programs.

Section 1.—Consolidated Government Finance Statistics

Tables 1 and 2 provide details of the federal and provincial-local government components of consolidated government revenue by source, and consolidated government expenditure by function. The object of these consolidations is to reflect the relationship between government and the public in respect of revenue raised and services provided. The consolidated net general figures were arrived at by eliminating from the gross revenue and the corresponding functionalized expenditure of each level of government, the following: conditional grants (grants-in-aid and shared-cost contributions); institutional revenue; and interest, premium, discount and exchange revenue. In addition, transfers of unconditional grants such as subsidy payments of the Federal Government to provincial governments have also been eliminated from the gross revenue of the receiving government and from the gross expenditure of the paying government. Because of the differing accounting practices of governments and the variations in fiscal year-ends, some discrepancies appear between amounts recorded as intergovernment transfers received and those recorded as paid.

* Except as otherwise indicated, revised in the Governments Division, Dominion Bureau of Statistics.

Section 2.—Taxation in Canada*

Canada is a federal state with a central government and ten provincial governments. In 1867, the principal colonies of the British Crown in North America joined together to form the nucleus of a new nation and the British North America Act of that year became its written constitution. This statute created a central government with certain powers while continuing the existence of political subdivisions called provinces with powers of their own.

Under the British North America Act, the Parliament of Canada has the right to raise "money by any mode or system of taxation" while the provincial legislatures are restricted to "direct taxation within the province in order to the raising of a revenue for provincial purposes". Thus, the provinces have a right to share only in the field of direct taxation while the Federal Government is not restricted in any way in matters of taxation. The British North America Act also empowers the provincial legislatures to make laws regarding "municipal institutions in the province". This means that the municipalities derive their incorporation with its associated powers, fiscal and otherwise, from the provincial government concerned. Thus, municipalities are also limited to direct taxation.

* Revised (July 1970) in the Tax Policy Division, Department of Finance, under the direction of F. R. Irwin, Director of the Division, and by the provincial authorities concerned.

A direct tax is generally recognized as one "which is demanded from the very person who it is intended or desired should pay it". This conception has limited the provincial governments to the imposition of income tax, retail sales tax, succession duties and an assortment of other direct levies. In turn, municipalities, acting under the guidance of provincial legislation, tax real estate, water consumption and places of business. The Federal Government levies taxes on income, on gifts and on the estates of deceased persons, as well as excise taxes, excise and customs duties, and a sales tax.

Starting in 1941, a series of federal-provincial tax agreements were concluded to promote the orderly imposition of direct taxes. The duration of each agreement was normally five years. Under the earlier agreements, the participating provinces undertook, in return for compensation, not to use or permit their municipalities to use certain of the direct taxes. Under the present arrangements, the federal income tax otherwise payable in all provinces and the estate tax otherwise payable in three provinces are abated by certain percentages to make room for provincial levies.

The current arrangements became operative on Apr. 1, 1962 and were originally scheduled to terminate on Mar. 31, 1967, but have been extended subject to termination on due notice being given. They amount to a partial federal withdrawal from the field of direct taxation and a re-entry of all provinces into the vacated area. The federal personal income tax otherwise payable on income earned in a province and on income received by a resident of a province is reduced by the following percentages: 16 p.c. for 1962 income, 17 p.c. for 1963 income, 18 p.c. for 1964 income, 21 p.c. for 1965 income, 24 p.c. for 1966 income and 28 p.c. for income in 1967 and subsequent years.* The abatements in respect of income earned in Quebec or received by a resident of Quebec are 44 p.c. for 1965 income, 47 p.c. for 1966 income and 50 p.c. for income in 1967 and subsequent years. The additional points of abatement in Quebec are to allow that province to collect revenue to pay for certain programs that are paid for in whole or in part by the Federal Government in other provinces. The Federal Government also reduces its rate of corporation income tax on taxable income of corporations earned in the provinces. The reduction was 9 p.c. of taxable income earned in any province except Quebec and 10 p.c. of taxable income earned in Quebec for the years from 1962 to 1967. The additional 1-p.c. reduction in respect of taxable income earned in the Province of Quebec for these years was to compensate for the additional tax levied by the province during this period on corporation income to provide grants to universities. These provincial grants replaced federal grants which in other provinces were paid to the universities by the Federal Government through the Canadian Universities Foundation. Starting in 1967, with the termination of direct federal financial assistance to universities, the abatement of the federal rate of corporation income tax is 10 p.c. of taxable income in all provinces. The Federal Government also abates the federal estate tax otherwise payable by 75 p.c. in respect of property situated in a province that levies its own death tax.†

These reductions in federal income tax and estate tax do not apply to the Yukon Territory or the Northwest Territories or to income earned outside Canada. The Yukon and Northwest Territories do not impose income taxes or death taxes.

The provincial tax rates are not restricted to the extent of the federal withdrawal. The constitutional position of the provinces permits them unlimited use of direct taxes for the raising of revenue for provincial purposes. However, in three provinces (Prince Edward Island, Nova Scotia and British Columbia), the provincial rates of income tax do not exceed the federal abatement.

* The original agreement provided for abatements of 19 p.c. for 1965 income and 20 p.c. for 1966 income. However, in 1964 the provinces were granted an additional two percentage points for 1965 income and four percentage points for 1966 income and in 1966 they were granted an additional four percentage points for 1967 and 1968 income.

† The original agreement was for a 50-p.c. abatement but at the conclusion of a federal-provincial conference in late 1963 it was increased to 75 p.c. in respect of deaths occurring after Mar. 31, 1964. Currently, only the estates of domiciliaries of British Columbia qualify for the full 75-p.c. abatement. Quebec and Ontario estates are temporarily eligible for only 50 p.c. because these two provinces have elected for the time being to take a payment from the Federal Government on account of the additional 25-p.c. abatement rather than to increase their succession duty rates.

As part of the current fiscal arrangements, the Federal Government has entered into tax collection agreements under which it collects the provincial personal income taxes for all provinces except Quebec and the provincial corporation income taxes for all provinces except Ontario and Quebec.

Subsection 1.—Federal Taxes

Individual Income Tax

Personal income taxation in Canada is on the basis of residence rather than citizenship. Every individual who is resident in Canada at any time during a year is liable for the payment of income tax on all his income. Every non-resident individual who is employed or carries on business in Canada during a year is liable for tax on his income earned in Canada. The term "residence" is difficult to define simply but, generally speaking, it is taken to be the place where a person resides or where he maintains a dwelling ready at all times for his use. There are also extensions of the meaning of Canadian resident to include a person who has sojourned in Canada for an aggregate period of 183 days in a taxation year, or a person who was during the year a member of the Armed Forces of Canada or an ambassador, a high commissioner, or an officer or servant of Canada or of any one of its provinces, or the spouse or dependent child of any such person. The extended meaning of residence also includes employees who go from Canada to work under certain international development assistance programs.

The Canadian tax law uses the concepts "income" and "taxable income". The income of a resident of Canada for a taxation year comprises his revenues from all sources inside or outside Canada and includes income for the year from all businesses, property, offices and employments. It does not include capital gains unless they arise out of the conduct of a business or as a result of an adventure in the nature of trade.

In computing his income for a taxation year, an individual must include all dividends, fees, annuities, pension benefits, allowances, interest, alimony, maintenance payments and other miscellaneous sources of income. On the other hand, war service disability pensions paid by Canada or an ally of Her Majesty at the time of the war service, unemployment insurance benefits, compensation in respect of an injury or death paid under a Workmen's Compensation Act of a province and family allowances do not have to be included in the computation of income.

In computing his income for a taxation year, an individual who is carrying on business may deduct business expenses including depreciation (called capital cost allowances), interest on borrowed money, reserves for doubtful debts, contributions to pension plans or deferred profit-sharing plans for his employees, bad debts, and expenses incurred for scientific research. In general, no deductions are allowed in computing income from salary and wages, although there are exceptions such as travelling expenses of employees who have to travel as they perform their work (such as employees on trains), union dues, alimony payments and contributions to registered pension plans. Individuals may deduct, within limits, amounts set aside to provide a future income under registered retirement savings plans. Students attending universities, colleges, high schools, public schools or certain other certified educational institutions in Canada may deduct their tuition fees if they exceed \$25 per annum. Students in full-time attendance at universities outside Canada may deduct their tuition fees.

Having computed his income, the individual then calculates his taxable income by deducting certain exemptions and deductions. These exemptions and deductions are as follows: for single status, \$1,000; for married status, \$2,000; for dependent children under age 16, \$300 per child; for other dependants (as defined in the law), \$550 per dependant; where the taxpayer is 70 years of age or over, an additional \$500; where the taxpayer is

blind or confined to a bed or a wheelchair, an additional \$500; charitable donations, up to 10 p.c. of income; and medical expenses, in excess of 3 p.c. of income. In lieu of claiming deductions for charitable donations and medical expenses, an individual may claim a standard deduction of \$100.
